**-ster**, A termination as in *malster*, *gamester*, *spinster*, *songster*, denoting occupation. In the earliest times, and up to about the end of the thirteenth century, it was generally the sign of the feminine gender, corresponding to the masculine *-er* or *-er*. In the fourteenth century it began to give place as a feminine termination to the Norman *-ess*. In modern literary English there is now only one feminine word with this suffix, viz. *spinster*; but *huckster* was used very late as a feminine; and in Scotch and provincial English *sewster* is still used. When the suffix *-ster* was felt no longer to mark the feminine distinctively, some new feminines were formed by the addition of the termination *-ess* to the *-ster*, as *songstress* and *seamstress*.

The suffix *-ster* now often marks the agent with more or less a sense of contempt and depreciation, as *funster*, *trickster*, *gamester*. *Dr. Morris.*

But we cannot recognize the termination *-ster* as being, or as having been at some time past, a feminine formative in every instance. Not only does the present use of such old words as *bastard*, *huckster*, *malster*, *songster*, *trickster*, not to urge the more recent *oldster*, *youngster*, *roadster*, make it hard to prove them all feminines; but even if we push our inquiries further back we nowhere find the group clearly defined as such except in modern Dutch. There was in Anglo-Saxon *fæder* and *æfter*, and yet Pharaoh's baker in Genesis xi. is *hæceter*. Grimm conjectured that these nouns in *-ster* are all that is left of an older pair of declensions, whereof one was masculine in *-ster*, the other feminine in *-stir*. *J. Earle.*

He taught that men should be free from passion, unmoved by joy or grief, and submit without complaint to the unavoidable necessity by which all things are governed. The Stoics are proverbially known for the sternness and austerity of their ethical doctrines, and for the influence which their tenets exercised over some of the noblest spirits of antiquity, especially among the Romans. Their system appears to have been an attempt to reconcile a theological pantheism and a materialist psychology with a logic which seeks the foundations of knowledge in the representations or perceptions of the senses, and a morality which claims as its first principle the absolute freedom of the human will. The Stoics teach that whatever is real is material; matter and force are the two ultimate principles; matter is of itself motionless and unformed, though capable of receiving all motions and all forms. Force is the active, moving, and moulding principle, and is inseparably joined with matter, the working force in the universe is God, whose existence as a wise thinking being is proved by the beauty and adaptation of the world. The supreme end of life, or the highest good, is virtue, that is, a life conformed to nature, the agreement of human conduct with the all-controlling law of nature, or of the human will with the divine will; not contemplation, but action, is the supreme problem for man; virtue is sufficient for happiness, but happiness or pleasure should never be made the end of human endeavour. The wise man alone attains to the complete performance of his duty; he is without passion, although not without feeling, he is not indulgent, but just toward himself and others, he alone is free, he is king and lord, and is inferior in inner worth to no other rational being, not even to Zeus himself. **Strength** (strēngth), *n.* [A. Sax. *strengthu*, strength, from *strang*, strong; comp. *length* and *long*. See **STRONG**.] 1. That property, attribute, or quality of an animal body by which it is enabled to move itself or other bodies. The strength of animals is the muscular force or energy which they are capable of exerting; as, not to have *strength* enough to lift the arm or to walk. In order to compare the effects produced by different animals, or the same animal under different circumstances, it is usual to estimate the force required to raise or transport 1 lb. through 1 foot of space in 1 minute of time, which force is called the *dynamic unit*. Hence, if an animal, as a horse, for example, is capable of raising 33,000 lbs. 1 foot high in a minute, he must exert a force 33,000 times greater than that required to raise 1 lb. through the same space in the same time. Of the different modes of estimating human strength the most practically useful is the observation of the average effect produced daily by a labourer who continues his exertions for a number of successive days, as in transporting materials in a wheelbarrow, carrying or dragging a load, working a pump, turning a winch, rowing a boat, &c.—2. The quality of bodies by which they sustain the application of force without breaking or yielding; solidity or toughness; as, the *strength* of a bone; the *strength* of a beam; the *strength* of a wall; the *strength* of a rope. The conditions which determine the strength of solid bodies, and their power to resist forces tending to produce fracture, are found by experiment. A force acting on solid bodies may tend to separate its parts in different ways. Thus a body may be torn asunder by a stretching or tensile force or direct pull applied in the direction of its fibres, as in the case of ropes, &c.; or it may be broken across by a transverse strain, crushed by a pressure exerted in the direction of its length, twisted, shorn across, &c.—3. Power or vigour of any kind; ability to do or bear; capacity for exertion, whether physical, intellectual, or moral; as, *strength* of mind, memory, or judgment; *strength* of evidence, argument, or persuasion; *strength* of feeling, affection, and the like.

Aristotle's large views, acuteness and penetration

equalled. *Locke*.

Will laugh a siege to scorn. *Shak*.

join. *Pope*.

That quality which tends to secure results; the effective power in an institution or what is established; legal or moral force; the quality of binding, influencing, or constraining; as, the *strength* of social or legal obligations; the *strength* of law; the *strength* of public opinion or custom.—10. Force as

measured or stated in figures; amount or numbers of any body, as of an army, fleet, or the like. 'Of what *strength* are they a-foot?' *Shak*. 'To decry the *strength* of the enemy.' *Shak*.—11. Force proceeding from motion and proportioned to it; vehemence; impetuosity; as, the *strength* of a current of air or water.—12. Fortification; fortress; stronghold. It was discovered by Dr. Hope in 1792. It has subsequently been found in England, America, and France; but strontite minerals are rather rare. The pure earth to which the name of strontia is given is prepared from the carbonate exactly like baryta. It is a grayish-white powder, infusible in the furnace; of a specific gravity approaching that of baryta, having an acrid burning taste, but not so corrosive as baryta, though sharper than lime, and an alkaline reaction. It becomes hot when moistened, and slakes into a pulverulent hydrate (Sr(OH)<sub>2</sub>), dissolves in 150 parts of water at 60°, and in much less at the boiling-point, forming an alkaline solution called *strontia water*, which deposits crystals in four-sided tables as it cools. These crystals have the composition Sr(OH)<sub>2</sub>.8H<sub>2</sub>O. It is readily distinguished from baryta by forming with hydrochloric acid a chloride which crystallizes in needles, and is very deliquescent, and soluble in alcohol, to which it gives the property of burning with a crimson flame. The sulphate of strontia is found native, and some of the native varieties have a pale blue tint, whence the term *celestia* (which see). The nitrate of strontia is used in making fireworks, as it communicates a magnificent red colour to flame.

The metal of which strontia is the oxide, procured from the carbonate of strontia by Davy in 1808. It is a dark yellow substance, less lustrous than barium; sp. gr. 2.54: it is difficultly fusible, and not volatile. When exposed to the air it attracts oxygen, and becomes converted into strontia, or protoxide of strontium; when thrown into water it decomposes it with great violence, producing hydrogen gas, and forming with the water a solution of strontia. Strontium is harmless, while barium and all its compounds are poisonous.

A member of the genus *Acipenser* family, which family is included under the name *Sturionidae*. The sturgeon is a large fish, the body of which is covered with bony plates in the dorsal and ventral portions. The mouth is small and edentulous, and the opercular bones, soldered to the head, convert them into the upper jaw. The mouth, placed on a pedicel that is more or less protruded, is more protractile than that of a shark. The eyes and nostrils are situated at the base of the head, and the gills are situated at the base of the mouth. On the back is a large dorsal fin, and the tail is forked. The sturgeon is found in the larger rivers of Europe and Asia, and is the object of a considerable fishery. The flesh of most of the species is much esteemed, and their scales are used in making isinglass. The sturgeon is a voracious fish, and is found in the rivers of Europe. Its flesh is much esteemed, and is well flavoured, somewhat like eel. When caught in the net, it is usually killed by the introduction of the Lord's Prayer into its ear. It is a royal fish, reserved for the use of the crown. The sterlet (*A. ruthenus*) is found in the Volga and the Danube. (See STURGEON.) The great white sturgeon, or *A. transmontanus*, is found in the Danube. The American sturgeon, or *A. oxyrinchus*, is found in the great rivers running into the Atlantic and Gulf of Mexico. It frequently grows to a length of 10 feet, and weighs

above 1200 pounds. The flesh is not much esteemed, but the finest isinglass is made from its air-bladder. There are several species peculiar to North America.

A pointed instrument or iron bodkin used by the ancients for writing by scratching on wax tablets. While the pointed end was used to form the letters, the other end, which was made blunt and smooth, was used for making erasures. From the instrument of writing the word came to signify a particular manner of writing. See 3 below.—2. Anything resembling a style in being pointed; as, (a) a pointed tool used in engraving; a graver. (b) a pointed surgical instrument; a probe. (c) The pin or gnomon of a sun-dial, which projects the shadow on the plane of the dial. (d) In bot. the prolongation of the summit of the ovary which supports the stigma. Sometimes it is entirely wanting, and then the stigma is sessile, as in the poppy and tulip. When the ovary is composed of a single carpel, the style is also single, and the number of styles varies according to the number of carpels, though when the carpels are numerous the styles may be united.

Considered in reference to its direction or position, the style may be lateral, basal, vertical, included, protruded, ascending, or declinate. Viewed in reference to its form, it may be filiform, subulate, trigonal, claviform, or petaloid. Viewed with reference to its divisions, it may be simple or divided; when the divisions do not extend far, it is a slit; when more prolonged, *artistic*. Thus it may be bifid or bipartite, trifid or tripartite, &c. After fecundation the style generally falls off, when it is said to be deciduous; but when it remains, it is said to be persistent.—3. Manner of writing with regard to language; the peculiar manner in which a person expresses his conceptions; the particular mode or form of expressing ideas in language which distinguishes one writer or speaker from another; the distinctive manner of writing which belongs to each author, and also to each body of authors, allied as belonging to the same school, country, or epoch.

Proper words in proper places make the true definition of a style. *Swift*.

Yet let some lord but own the happy lines  
How the wit brightens and the style refines! *Pope*.

The style which deals in long sentences or in short sentences, or indeed which has any trick in it, is a bad style. . . . The best thing which, to my mind, has been ever said about style was said in a metaphorical way, the writer declaring that the style should, as it were, involve and display the subject-matter, as the drapery in a consummate statue looks over and around the figure. *Sir A. Helps*.

4. Mode of presentation, especially in music or any of the fine arts; characteristic or peculiar mode of developing an idea or accomplishing a result. Style in the arts depends on the character of the artist, the subjects, the art itself, the materials used, the object aimed at, &c. The style varies in different periods, and is also influenced by differences of national character. The various branches of an art, too, have each its peculiar style. Thus in poetry there are the epic, lyric, and dramatic styles; in music, the sacred, opera, and concert styles; the vocal and instrumental styles; the sonata and symphony styles, &c.; in painting there are the historical, landscape, &c. styles.—5. External manner or fashion; often, manner deemed elegant and appropriate in social demeanour; fashion; as, the entertainment was got up in excellent style.—6. Phrase of address or appellation; formal or official designation; title; as, any one having the style of majesty. 'One style to a gracious benefactor, another to a proud insulting foe.' *Burke*.—7. eral artistic idea pervading a building: as, the Gothic style, the Grecian style, the Moorish style, the Norman style, &c.—*s. in astron.* a mode of reckoning time with regard to the Julian and Gregorian calendar (See OMBROSIAN, JULIAN). *Style is Old or New.* The Old Style follows the Julian manner of computing the months and days, in which the year consists of 365 days and 6 hours. This is something more than 11 minutes too much, and in the course of time, between Omar and Pope Gregory XIII., this accumulated error amounted to 10 days. Gregory reformed the calendar by retrenching 10 days, and fixing the ordinary length of the civil year at 365 days, and to make up for the odd hours it was ordained that every fourth year (which we call leap-year) should consist of 366 days. But the true length of the solar year is only 365 days 5 hours 48 minutes 51 seconds; hence, four solar years would fall short of four years of 365 days 6 hours each, or of four Julian years, three of 365 days and one of 366 days, by 44 minutes 33 seconds, and 400 solar years would fall short of 400 Julian years by 74 hours 16 minutes, or by a little more than three days. This error it was ordained should be rectified by omitting three days in three of the four years which completed centuries, or, in other words, that the centuries divisible without remainder by 400, should alone of the centuries be accounted leap-years. Thus 1600, 2000, 2400 would be leap-years, but not 1700, 1800, 1900, 2100, 2200, 2300. This mode of correcting the calendar has been adopted at different times in almost all civilized nations with the exception of Russia and those countries where the Greek Church is predominant, which still adhere to the Old Style. In England the Gregorian or New Style was adopted by act of parliament in 1752, and as one of the years concluding a century in which the additional or intercalary day was to be omitted (the year 1700) had elapsed since the correction by Pope Gregory, it was necessary to omit 11 instead of 10 days in the current year. Accordingly 11 days in September, 1752, were retrenched, and the 3d day was reckoned the 14th. The difference between the Old and New Styles is now 12 days.—*Style of a court.* in law, the practice observed by any court in its way of proceeding.—*Judicial styles.* in Scots law, the particular forms of expression and arrangement necessary to be observed in formal deeds and instruments.—*Dictio, Phrasology, Style.* See under Dictio.

**Sublimation** (sub-li-mä'shon), *n.* 1. In chem., the act or process of sublimating; a process by which solid substances are, by the aid of heat, converted into vapour, which is again condensed into the solid state by the application of cold. Sublimation bears the same relation to a solid that distillation does to a liquid. Both processes purify the substances to which they are severally applied, by separating them from the fixed and grosser matters with which they are connected. Sublimation is usually conducted in one vessel, the product being deposited in the upper part of the vessel in a solid state, and often in the crystalline form, while the impurity remains in the lower part. If iodine, for example, be heated in a Florence flask a purple vapour rises, which almost immediately condenses in small brilliant, dark-coloured crystals in the upper part of the flask, the impurity remaining in the lower. The vapour of some substances which undergo the process of sublimation condenses in the form of a fine powder called *flowers*; such are the *flowers of sulphur*, *flowers of benzoin*, and others of the same kind. Other sublimates require to be in a solid and compact form, as camphor, hydrochlorate of ammonia, and all the sublimates of mercury.—2. (c) Grandeur; vastness; elevation, whether exhibited in the works of nature or of art; as, the sublimity of a scene or of a building. 2. The emotion produced by what is sublime; a feeling produced by the contemplation of great scenes and objects, or of exalted excellence. *Note.* The true nature of sublimity, whether of the emotion or that which causes it, is a subject of great interest and importance in mental philosophy, and it has always been a favourite subject of speculation. The invariable condition of sublimity in objects, either material or moral, is vastness, power, or intensity. The invariable condition of the emotion of sublimity—that which distinguishes this emotion from every other emotion—is a comprehension of this vastness or power, with a simultaneous feeling of our own comparative insignificance. The antithesis to the emotion of sublimity is the emotion of contempt. In every case of sublimity in material objects, whatever feelings may simultaneously concur, vastness will be found to be an invariable condition—vastness either of form or of power, as in the violent dashing of a cataract, in the roar of the ocean, in the violence of the storm, in the majestic quiet of Mount Blanc, preserving its calm amidst all the storms that play around it. In the moral world the invariable condition of sublimity is intensity. Mere intensity is sufficient to produce the sublime. Lear, who appeals to the heavens, 'for they are old like him,' is sublime from the very intensity of his sufferings and his passions. Lady Macbeth is sublime from the intensity of her will, which crushes every female feeling for the attainment of her object. Scævola, with his hand in the burning coals, exhibits an intensity of will which is sublime. In all the cases above mentioned we are moved by a vivid feeling of some greater power than our own, or some will more capable of suffering, more vast in its strength, than our feeble vacillating will.—3. † The sublimest or highest degree of anything; the height.

purified by solution in water and filtration, sent through cotton bags, then through layers of animal charcoal, boiling down under diminished pressure, and crystallization. Thus clarified it takes the names of *lump*, *leaf*, *refined*, &c., according to the different degrees of purification. The manufacture of sugar from beet-root is carried on to a very considerable extent in France, Germany, Austria, Belgium, Holland, Russia, &c. In the United States and in Canada great quantities of sugar are obtained from the sap of the sugar-maple (*Acer saccharinum*). Sugar is a proximate element of the vegetable kingdom, and is found in most ripe fruits and many farinaceous roots. By fermentation sugar is converted into alcohol, and hence forms the basis of those substances, as molasses, grapes, apples, malt, &c., which are used for making intoxicating liquors. The West Indies, Brazil, British Guiana, and Java are the principal sources whence our supplies of cane-sugar are derived; the sugar used on the Continent is chiefly obtained from the beet. Sugar was only vaguely known to the Greeks and Romans, it seems to have been introduced into Europe during the time of the crusades. The cane was grown about the middle of the twelfth century in Cyprus, whence, some time later, it was transplanted into Madeira, and about the beginning of the sixteenth century it was thence carried to the New World. Of all vegetable principles it is considered by many eminent physicians as the most wholesome and nutritious. Chemically, sugar is the representative of a class to which the names of *saccharose* or *saccharose* is given. Besides the saccharose the chemist is acquainted with another group of bodies represented by the sugar of most fruits, which he calls *glucosae*. The saccharose have the general formula  $C_{12}H_{22}O_{11}$ , the glucosae, the general formula  $C_6H_{12}O_6$  (being a whole number, whether unity or greater than unity is not as yet certainly known). When completely oxidized all sugars yield carbon dioxide and water; much heat is evolved during the oxidation. 2 That which resembles sugar in any of its properties; as, *sugar of lead*, the acetate of lead, called *saccharum saturni* by the older chemists, from a supposed resemblance in its crystals to sugar, or from their having a slight sweetness in the mouth. Sugar of lead, though poisonous, is useful in medicine, having a strongly detergent quality; and it is much employed in calico-printing. — 3 *Sg* sweet, honeyed, or soothing words; flattery employed to disguise something distasteful. — *Sugar of milk*, lactine (which see). — *Sugar of scorns*, quercite (which see).

As the ascending sap is richest in sugar the trees are tapped in the early spring. From the troughs it is conveyed to boilers, and manufactured into sugar on the spot. See *MAPLE*.

pressed from them. The annexed illustration represents a form of sugar-mill in common use. The motive power is applied directly to the upper roller, and is communicated with an equal velocity, by means of spur pinions, to the two lower rollers, which are brought nearly into contact with the upper, and the extremities of the axes of which are seen in the cut. The canes are spread upon the feeding-table regularly, and as nearly as possible at right angles to the axes of the rollers, and are first drawn downward between the upper and first lower roller then upwards between the upper and second lower roller, being thus crushed so as to separate the liquor, which flows downwards into the hollow bed of the mill, and is then drawn off by a spout while the empty canes are detached from the rollers, and guided to the floor of the mill by the delivering board.

Sulphuric acid is dibasic, forming two classes of sulphates, viz. *neutral sulphates*, in which the two hydrogen atoms of the acid are replaced by metal, and *acid sulphates*, in which one hydrogen atom only is so replaced. The general formula of the former class is M<sub>2</sub>SO<sub>4</sub>, and of the latter MHSO<sub>4</sub>. (M represents a monovalent metal.) Of the sulphates, some are found native; some are very soluble, some sparingly soluble, and some insoluble. All those that are soluble are recognized in solution by the test of nitrate or chloride of barium, which causes a white precipitate of sulphate of barium, insoluble in acids. All the insoluble sulphates, when fused with carbonate of soda, yield sulphate of soda, which may be recognized as above. Some neutral sulphates occur in the anhydrous state, and others occur combined with water. The most important sulphates are—sulphate of aluminium and potassium, or alum; sulphate of ammonium, employed for making carbonate of ammonia; sulphate of copper, or blue vitriol, much used as an escharotic in surgery, and also used in dyeing and for preparing certain green pigments; sulphate of iron, or green vitriol, used in making ink, and very extensively in dyeing and calico-printing; it is also much used in medicine; sulphate of calcium, or gypsum; sulphate of magnesium, or Epsom salt; sulphate of manganese, used in calico-printing; sulphate of mercury, used in the preparation of corrosive sublimate and of calomel; bisulphate of potash, much used as a flux in mineral analysis; sulphate of sodium, or Glauber's salt; sulphate of quinine, much used in medicine; sulphate of zinc, or white vitriol, used in surgery, also in the preparation of drying oils for varnishes, and in the reserve or resist pastes of the calico-printer. and purity in the neighbourhood of volcanoes, modern or extinct, as in Sicily; and, as an article of commerce, is chiefly imported from the Mediterranean. That which is manufactured in this country is obtained by the roasting of iron pyrites. It is commonly met with in two forms; that of a compact, brittle solid, and a fine powder. It is nearly tasteless, of a greenish yellow colour, and when rubbed or melted emits a peculiar odour. Its specific gravity is 1.99; it is insoluble in water, and not very readily soluble in alcohol, but is taken up by spirits of turpentine, by many oils, and by carbon disulphide. It is a non-conductor of electricity. It is readily melted and volatilized. It fuses at 232° Fahr., and between 232° and 280° it possesses the greatest degree of fluidity, and when cast into cylindrical moulds forms the common roll-sulphur of commerce. It possesses the peculiar property of solidifying at a higher degree, or when raised to 320°. Between 430° and 480° it is very tenacious. From 480° to its boiling-point (792°) it again becomes liquid. At 792° it rises in vapour, and in close vessels condenses in the form of a fine yellow powder, called *flowers of sulphur*. When sulphur is heated to at least 480°, and then poured into water, it becomes a ductile mass, and may be employed for taking the impressions of seals and medals. Sulphur exists in two distinct crystalline forms, and also as an amorphous variety; these modifications are characterized by differences in specific gravity, in solubility in various liquids, and in many other points. Sulphur combines with oxygen, hydrogen, chlorine, &c., forming various important compounds. It unites also with the metals, forming sulphides. It is of great importance in the arts, being employed in the manufacture of gunpowder, lucifer-matches, vulcanite, and sulphurous and sulphuric acids. It is also employed in medicine, and for various other purposes.—*Crude sulphur*, the result of the distillation of native sulphur.—*Sulphur group*, the elementary substances sulphur, selenium, and tellurium; all having a strong attraction for oxygen.—*Roll or stick sulphur*, sulphur refined and cast into wooden moulds.—2. † Considered as that of which lightning consists.

**Sulphuretted** (sul-fūr-et-ed), *a.* Applied to bodies having sulphur in combination.—

*Sulphuretted hydrogen* ( $H_2S$ ), a compound formed when hydrogen and sulphur come in contact in the nascent state. It is a transparent colourless gas, recognized by its peculiar fetid odour, resembling that of putrid eggs. It is very deleterious to animal life, and is often formed where animal matters or excrements putrefy. It is the active constituent of sulphurous mineral waters. It is also known by the name of *Hydrosulphuric Acid*, *Sulphydric Acid*, and *Hydrothionic Acid*. It is usually prepared by decomposing a metallic sulphide, especially sulphide of iron or of antimony, by means of hydrochloric or sulphuric acid.

**Sulphuric** (sul-fūr-ik), *a.* Pertaining to or obtained from sulphur.—*Sulphuric acid*, oil

of vitriol, a most important acid, discovered by Basil Valentine towards the close of the fifteenth century. It was formerly procured by the distillation of dried sulphate of iron, called *green vitriol*, whence the corrosive liquid which came over in the distillation, having an oily consistence, was called *oil of vitriol*. It is now prepared in this and most other countries by burning sulphur, or more frequently iron pyrites, in closed furnaces, and leading the fumes, mixed with oxides of nitrogen, into large leaden chambers, into which jets of steam are continuously sent. The oxides of nitrogen are produced by the action of sulphuric acid upon nitre contained in pots, which are placed between the sulphur ovens and the chambers. The sulphur dioxide takes away part of the oxygen from the oxides of nitrogen, which are again oxidized by the air in the chambers. The sulphur trioxide produced unites with the steam to form sulphuric acid. The acid produced in the chamber is condensed in leaden vessels until it reaches a certain gravity, when it is run into glass, or sometimes into platinum vessels, where the condensation is continued. Pure sulphuric acid is a dense, oily, colourless fluid, having, when strongly concentrated, a specific gravity of about 1.8. It is exceedingly acid and corrosive, decomposing all animal and vegetable substances by the aid of heat. It unites with alkaline substances, and separates most of the other acids from their combinations with the alkalis. It has a very great affinity for water, and unites with it in every proportion, producing great heat; it attracts moisture strongly from the atmosphere, becoming rapidly weaker if exposed. The sulphuric acid of commerce is never pure, but it may be purified by distillation. With bases sulphuric acid forms salts called sulphates, some of which are neutral and others acid. By concentrating sulphuric acid as far as is possible without decomposition, and cooling the liquid so obtained, crystals of the true acid,  $H_2SO_4$ , are formed. The ordinary acid is a hydrate of  $H_2SO_4$ , of varying composition. A form of sulphuric acid known as *Nordhausen acid* is prepared by heating green vitriol in closed vessels; it is a solution of sulphur trioxide in sulphuric acid ( $H_2SO_4$ ), or it may be regarded as *pyrosulphuric acid* ( $H_2S_2O_7$ ). The best test of the presence of sulphuric acid, whether free or combined, is a soluble compound of barium. Thus, when a solution of chloride of barium is added to a liquid containing sulphuric acid it causes a white precipitate, viz. sulphate of barium, which is not only insoluble in water, but in the strongest acids. Of all the acids the sulphuric is the most extensively used in the arts, and is in fact the primary agent for obtaining almost all the others by disengaging them from their saline combinations. Its uses to the scientific chemist are innumerable. In medicine it is used in a diluted state as a refrigerant. See **SULPHATE**.—*Sulphuric ether*, ethylic, vinic, or ordinary ether—( $C_2H_5O$ )—a colourless transparent liquid, of a pleasant smell and a pungent taste, extremely exhilarating, and producing a degree of intoxication when its vapour is inhaled by the nostrils. It is produced by distilling a mixture of equal weights of sulphuric acid and alcohol, and by various other means. Its specific gravity is 0.720. It is extremely volatile and highly inflammable; and its vapour, mixed with oxygen or atmospheric air, forms a very dangerous explosive mixture. It dissolves in 10 parts of water, and is miscible with alcohol and the fatty and volatile oils in all proportions. It is employed in medicine as a stimulant and antispasmodic. The vapour of ether has been administered with success to patients when about to undergo surgical operations, but it is now to a great extent superseded by chloroform. True sulphuric ether, known also as *sulphate of ethyl*—( $C_2H_5SO_4$ )—is an oily liquid, of burning taste and ethereal odour, resembling that of peppermint, of sp. gr. 1.120, and almost incapable of being distilled without decomposition, as at a temperature of about 280° it resolves itself into alcohol, sulphurous acid, and olefant gas.—*Sulphuric azide*, or sulphur trioxide ( $SO_3$ ), is a white crystalline body produced by the oxidation of sulphurous oxide (which see). When this oxide is thrown into water it combines rapidly with the latter to form sulphuric acid.

It has considerable bleaching properties, so that the fumes of burning sulphur are often used to whiten straw, and silk and cotton goods. of the equator it may be roughly said to include the months of June, July, and August. Astronomically considered, summer begins in the northern hemisphere when the sun enters Cancer, about the 21st of June, and continues for three months, till September 22d, during which time the sun, being north of the equator, shines more directly upon this part of the earth, which renders this the hottest period of the year. Sax. *sól*; these forms coinciding with L. *sol*; also (with common interchange of *s* and *h*) Gr. *helios*, W. *haul*, Corn. *haul*, Armor. *heol*. From a root meaning to shine.] 1. The splendid orb or luminary which, being in or near the centre of our system of worlds, gives light and heat to all the planets, and is therefore the primary cause of all the motions and changes effected on the surface of our globe by those mighty agents. All the planets and comets of our system revolve round the sun as a common centre, at different distances and in different periods of time. Its mean apparent diameter is about 32 minutes, and its mean distance from the earth about 92,000,000 of miles. Its real diameter is 860,000 miles, and hence its volume is equivalent to about 1½ million times the volume of our earth; but its mean density is only a fourth of that of the earth. It revolves on its axis from west to east in 25½ of our mean solar days, the axis being inclined at an angle of 87° 40' to the plane of the ecliptic. When viewed through powerful telescopes the sun's disc is observed to have large and perfectly black spots upon it, several of which are usually visible at once. These spots present the appearance of black irregular patches, and have been proved to be hollows in the luminous surface of the sun. (See *Solar spots* under *SOLAR*.) These spots appear and disappear very irregularly, some lasting for weeks and months, others only a day. Around the spots, and on other places, there are often masses brighter than the general surface, called *faculae* or *torches*. The general surface itself is not uniform, but appears mottled, and made up of bright roundish patches, with soft edges, sprinkled irregularly on a less luminous background. The luminous surface of the sun is called the *photosphere*. The photosphere is overlaid by an atmosphere which is invisible under ordinary circumstances, but reveals itself to the spectroscopic, and at a total eclipse forms the white halo or *corona* which is seen surrounding the moon. Within the corona are seen oddly shaped masses of a red colour, projecting considerably at various points beyond the moon's edge, and these projections are united by a continuous belt of similar, though less vivid colour. This belt is called the *chromosphere*, and these reddish masses are great clouds or flames of incandescent hydrogen. The spectroscopic has shown the sun to be composed of substances identical, partly at least, with those composing the earth, as hydrogen, sodium, iron, magnesium. The matter is so intensely hot as to be largely in the state of vapour. The amount of light sent forth by the sun is not exactly measurable, but the amount of heat has been pretty accurately computed, and it is certainly enormous. It is equivalent in mechanical effect to the action of 7000 horse-power on every square foot of the solar surface, or to the combustion on every square foot of upwards of 13½ cwts. of coal per hour.—2. In popular usage, the sunshine; a sunny place; a place where the beams of the sun fall; *as, to stand in the sun, that is, to stand where the direct rays of the sun fall.*—3. Anything eminently splendid or luminous; that which is the chief source of light, honour, glory, or prosperity.

I will never consent to put out the sun of sovereignty to posterity. *Edm. Basilide.*

4. The luminary or orb which constitutes the centre of any system of worlds; *as, the fixed stars are suns in their respective systems.*—5. A revolution of the earth round the sun; a year.

motion of the beam into a rotary motion. In the annexed figure the sun wheel *a*, is a toothed wheel fixed fast to the axis of the fly-wheel, and the planet wheel *b* is a similar wheel bolted to the lower end of the connecting-rod *c*. It is retained in its orbit by a link at the back of both wheels. By the reciprocating motion of the connecting-rod the wheel *b* is compelled to circulate round the wheel *a*, and in so doing carries the latter along with it, communicating to the fly-wheel a velocity double of its own. — *Sun* forms the 3rd element of many self-explanatory compounds, as *sun-bright*, *sun-dial*, *sun-dried*, *sun-like*, *sun-ht*, *sun-scorched*, &c.

**Sun (sun)** *v.t. pres. & pp. sunned, ppp. sunning*. To expose to the sun's rays, to warm or dry in the light of the sun; to incubate; as, to *sun* cloth, to *sun* grain. 'To *sun* thyself in open air.' *Dryden*.

given to dials are almost infinite. — **Papal supremacy**, the authority, legislative, judicial, and executive, which the pope exercised over the churches of England, Scotland, and Ireland until the middle of the sixteenth century, when it was abolished, and which still continues to be more or less recognized in all countries whose inhabitants are in communion with the Church of Rome. — **Royal supremacy**, the authority and jurisdiction which the sovereign of England exercises over the Church of England, as being the supreme head on earth of that church. **Sura** (sū-ra), *n.* [Ar.] A chapter of the Koran.

These chapters were, it is asserted, given forth successively to a whole, sometimes in dreams, and often in single verses. Such doctrine Mohammed, it is said, directed his amanities to cover in the *suras* which treated of such and such a subject. If this tradition be authentic, it would indicate that Mohammed viewed the Koran to be arranged according to its matter, and not chronologically, and hence the difficulty of assigning dates to each *sura*, or portion of a *sura*, is indefinitely increased. *Brande & Co.*

**Suradani** (sū-ra-dā-ni), *n.* A valuable kind of wood growing in Damaru, much used for timber, rails, masts and sails of wharves, and the like.

*Surcoat* seems to have originated with the ar-

aders, partly for the purpose of distinguishing the many different nations serving under the banner of the cross.

**Surd** (sér'd), *n.* 1. In *math.* an irrational quantity; a quantity which is incommensurable to unity. Or, a *surd* denotes the root of any quantity, when that quantity is not a complete power of the dimension required by the index of the root. Hence, the roots of such quantities cannot be expressed by rational numbers. Thus the square root of 2 (or  $\sqrt{2}$ ), the cube root of 4 ( $\sqrt[3]{4}$ ), the fourth root of 7 ( $\sqrt[4]{7}$ ), &c., are *surds*, for they cannot be expressed by rational numbers. 2. It is often nearly equivalent to verily, of a truth.

He that is *surety* for a stranger shall smart for it. *Prov. xi. 15.*

Hence—7. A substitute; a hostage.—*Surety of the peace*, the acknowledgment of a bond to the sovereign, taken by a competent judge of record, for keeping the peace. A magistrate or a justice of the peace may bind all those to keep the peace who make affray, or contend together with hot and

angry words, or go about with unlawful weapons or attendance to the terror of the people. So if a private man has just cause to fear that another will burn his house, or do him a corporal injury, or will procure others to do so, he may demand *surety* of the peace against such person, and every justice of the peace is bound to grant it if satisfied that the person has good grounds for the application.

The swell of the sea which breaks upon the shore, or upon sandbanks or rocks.—2. In *agri.* the bottom or conduit of a drain. [*Local*.]

**Surface** (sér'fás), *n.* [*Fr. surface*, from *sur*, upon, and *face*, or directly from *L. superficies*.] 1. The exterior part of anything that has length and breadth; one of the limits that terminates a solid; the supericies; outside; as, the *surface* of the earth; the *surface* of the sea; the *surface* of a diamond; the *surface* of the body; the *surface* of a cylinder; an even or an uneven *surface*. Popularly, *surface* is often used to signify, not merely the outside or exterior boundary of any substance, but also a certain thickness of the exterior material part. In this way we speak of the *surface* of the earth, the *surface* of the soil, of taking off the *surface* of anything, &c.—2. In *geom.* a supericies; that which has length and breadth only, and so distinguished from a *line*, which has length only, and from a *solid*, which has length, breadth, and thickness. The extremities of a *surface* are lines, and the intersections of one *surface* with another are also *lines*.—A *plane surface* is that in which any two points being taken the straight line between them lies wholly in that *surface*.—A *surface* which may be cut by a plane through any given point, so that the line of common section of the plane and *surface* may be a curve, is called a *curved surface*; as the *surface* of a sphere, cylinder, or cone. *Surfaces* are distinguished algebraically by the nature and order of their equations. Thus, we have *surfaces* of the first order, or plane *surfaces*, and *surfaces* of the second order, or curved *surfaces*. *Surfaces* are also distinguished by their mode of generation; thus the *surface* of a sphere is generated by the revolution of a semicircular arc about the diameter, which remains fixed. In *physics*, a *surface* is supposed to be composed of a number of material particles, placed together side by side, without any opening or interstice between them. Such a *surface*, therefore, cannot be said to be absolutely destitute of thickness, but may be regarded as a film of matter whose thickness is indefinitely small.—*Tabular surface*, a *surface* generated by a circle of a given radius, which moves with its centre on a given curve, and its plane at right angles to the tangent of that curve.—*Ruled surface*, a *surface* described by the motion of a straight line, which neither remains parallel to a given line nor always passes through a given point, as conoidal *surfaces*.—*Developable surface*, a *surface* that can be unwrapped in a plane without any doubling of parts over one another, or separation, as the *surface* of the cylinder and cone.—*Undevelopable surface*, a *surface* that cannot be developed in the plane.—3. Outward or external appearance; what appears on a slight or casual view or without examination; as, this arrangement, on the *surface*, was very advantageous.—4. In *fort.* that part of the side which is terminated by the flank prolonged, and the angle of the nearest bastion.

**Surface** (sér'fás), *a.* Of or pertaining to the *surface*; external; hence, superficial; specious; insincere; as, mere *surface* politeness or loyalty.

5. Security against loss or damage; security for payment.

There remains unpaid A hundred thousand more, in *surety* of the which One part of Aquitain is bound to us. *Shak.*

6. In law, one bound with and for another who is primarily liable, and who is called the principal; one who enters into a bond or recognizance to answer for another's appearance in court, or for his payment of a debt or for the performance of some act, and who, in case of the principal's failure, is compellable to pay the debt or damages; a bondsman; a bail.

**Swedenborgian** (swéd-den-bor'ji-an), n. One who holds the doctrines of the New Jerusalem Church as taught by Emanuel Swedenborg, a Swedish nobleman, born at Stockholm in 1689. He professed himself to be the founder of the New Jerusalem Church, alluding to the New Jerusalem spoken of in the book of the Revelation, and conceived that the members of this church were gifted with peculiar insight into spiritual things. The Swedenborgians believe that the regenerate man is in direct communication with angels and with heaven. They maintain that the sacred Scriptures contain three distinct senses, called celestial, spiritual, and natural, which are united by correspondences, and are accommodated respectively to particular classes, both of men and angels. They hold that there have been various general judgments ending particular dispensations of divine revelation. The last was in 1757, when Swedenborg received the office of teaching the doctrines of the new church promised in the Apocalypse. As this church is to be eternal there will be no other general judgment, but each individual is judged soon after death. There are numerous societies of them both in Great Britain and America.

The weight of the swift is most disproportionately small to its extent of wing, the former being scarcely an ounce, the latter 18 inches, the length of the body being near 8 inches. The swift is widely spread through Europe, Asia, and Africa. The American swift (*Chaetura pelagica*) is smaller, has the hind toe directed backwards, and the tail feathers stiff as in wood peckers. It is commonly called the chimney swallow. 4 The common swift or owl, a species of lizard.

Also written *Sycamor*. — 2. A *Persea plicata*, or sycamore-maple, a well-known large timber tree, long naturalized in England, and much used in ornamental planting. and quality. The quantity and quality of propositions, in logic, are marked by arbitrary symbols, as A, E, I, O. Every assertion may be reduced to one of four forms—the universal affirmative, marked by A; the universal negative, marked by E; the particular affirmative, marked by I; and the particular negative, marked by O. From these, by combination, all syllogisms are derived. In order to remember the figures, certain mnemonic words have been long used by writers on logic; thus, under the first figure, we have Barbara, Celarent, Daril, Ferio; under the second, Cesare, Camestres, Festino, Baroko; under the third, Darapti, Disamis, Datisi, Felapton, Bocardo, Feriso; and under the fourth, Brannantip, Camenes, Dimaris, Fesapo, Fresison. (See these words.) Each of these words designates a particular mood. The rules of syllogism may be thus briefly expressed: (a) one at least of the premises must be affirmative, and one at least universal; (b) the middle term must enter universally in one of the premises; and (c) the conclusion must not speak of any term in a wider sense than it was spoken of in the premise in which it entered. A term universally spoken of is either the subject of a universal affirmative, or the predicate of any negative. Syllogisms are nothing else than reasoning reduced to form and method, and it is well to know, when an argument is presented in a puzzling or perplexing form, with perhaps a suppression of one of its essential propositions, how to supply the suppressed premises and put the argument into regular order; the truth or fallacy of the reasoning then become apparent at a glance.—2. (3) *Provincial*, in which the bishops and delegated clergy of one province only meet. This is called a convocation. (4) *Diocesan*, in which the bishop and delegated clergy of a particular diocese meet. In the Established Church of Scotland, a provincial synod is one of the church courts, composed of the several presbyteries within the bounds prescribed by the General Assembly, or of the ministers and elders who stand on the roll as constituent members of such presbyteries. The synod is a court of review immediately above the presbytery, but its judgments may be brought under the review of the General Assembly by reference, complaint, or appeal. Other presbyterial bodies have synods, which are similarly constituted.—2. A meeting, convention, or council.

Properly defined, *synonyms* are words of the same language and the same grammatical class, identical in meaning or more generally, *synonyms* are words of the same language which are the precise equivalents of each other. And if a derivation of the word in the singular is inserted, we may say that a noun as other part of speech identical in meaning with another word of the same language and the same grammatical class, is the *synonym* of that word, or, less specifically, a *synonym* is a word identical in meaning with another word of the same language and the same grammatical class. But though this is the proper definition of true *synonyms*, it is by no means the ordinary use of the term, which is gener-

ally applied to words not identical, but similar, in meaning. Both in popular literary acceptance, and as employed in special dictionaries of such words, *synonyms* are words sufficiently alike in general signification to be liable to be confounded, but yet so different in special definition as to require to be distinguished. *G. P. Marsh.*

It is a worse preservative of a general constitution than the *systasis* of Great Britain, the Confederation of Poland, or any other ill-devised corrective which has yet been imagined in the necessities produced by an ill-constructed system of government. *Burke.*

**System** (sîs'tem), *n.* [Fr. *système*, L. *systema*, Gr. *systema*, from *systêmê*, to place together—*syn*, with, together, and *histêmê*, to set.] 1. Any combination or assemblage of things adjusted into a regular and connected whole; a number of things or parts so connected as to make one complex thing; things connected according to a scheme; as, a *system* of canals for irrigation; a *system* of pulleys; a *system* of forces acting on a body.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of, and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this one or more ends. Let us instance in a watch. *Butler.*

Hence, more specifically, (a) a number of heavenly bodies connected together and acting on each other according to certain laws; as, the solar *system*; the *system* of Jupiter and his satellites. 'Star and *system* rolling past.' *Tennyson.*

Who sees with equal eye, as God of all,  
A hero perish or a sparrow fall,  
Atoms or *systems* into ruin hurled,  
And now a bubble burst and now a world. *Pope.*

(b) An assemblage of parts or organs in an animal body which are composed of the same tissues or are essentially necessary to the performance of some function; as, the absorbent *system*, the nervous *system*, the vascular *system*; hence, also, the body itself as a functional unity or whole; as, to take poison into the *system*.—2. A plan or scheme according to which things are connected into a whole; a regular union of principles or facts forming one entire whole; an assemblage of facts, or of principles and conclusions scientifically arranged, or disposed according to certain mutual relations so as to form a complete whole; a connected view of all the truths or principles of some department of knowledge; as, a *system* of philosophy; a *system* of government; or a *system* of divinity; a *system* of botany or of chemistry.—3. A *method* or order; as, to have no *system* in one's business or study; to work according to a *system*.—4. In *astron.* any hypothesis or theory of the disposition and arrangements of the heavenly bodies by which their phenomena, their motions, changes, &c., are explained; as, the Ptolemaic *system*; the Copernican *system*; a *system* of the universe, or of the world. See SOLAR.—5. In *fine arts*, a collection of the rules and principles upon which an artist works.—6. subordination of parts to each other, and to the design of the whole; as, a *systematic* arrangement of plants or animals; a *systematic* course of study.

Now we deal much in essays, and unreasonably despise *systematical* learning; whereas our fathers had a great value for regularity and system. *Watts.*

2. Proceeding according to system or regular method; as, a *systematic* writer.—3. Of or pertaining to the system of the universe; cosmical. 'Upon which accounts these ends may be called cosmical or *systematical*.' *Boyle.*

In *physiol.* pertaining to the body as a whole; common to a general system; as, *systemic* circulation; that is, the circulation of the blood through the body generally, as distinguished from that other circulation which is confined to the respiratory organs and the heart, or the pulmonary or respiratory circulation.

The blood of reptiles is cold—that is to say, slightly warmer than the external medium—owing mainly to the fact that the pulmonary and *systemic* circulations are always directly connected together, either within the heart or in its immediate neighbourhood, so that the body is supplied with a mixture of venous and arterial blood in place of arterial blood alone. *H. A. Nicholson.*

Jambolanense* is extensively cultivated in the East Indies on account of its edible fruit, sometimes called Java plum by Europeans, but jamoon by the natives. It is of a rich purplish colour, and of a substringent sweetish taste, which

is more agreeable to the native than to the European palate. The bark is astringent, and dyes a brown colour; the wood is hard and durable, and much employed.

**Szygy** (sí-zí-jí), *n.* [*Gr. syzygia*, *syn*, together, and *zygon*, a yoke.] 1. In astronomy, the conjunction or opposition of a planet with the sun, or of any two of the heavenly bodies. ## T.

**T** is the twentieth letter of the English alphabet, a sharp mute consonant, closely allied to *d*, both being dentals. In forming it the tip of the tongue is pressed close to the root of the upper teeth, as may be perceived in uttering the syllables *at*, *et*, *it*. This is also the position of the tongue for the letter *c*, as in the syllables *ac*, *ec*, *oc*, *ic*; but *d* is uttered with voice, whereas *t* is entirely non-vocal. In reality, *t* can be hardly said to have any sound at all, its use, like that of the other sharp mutes *k* and *p*, being merely to modify the manner of uttering the vocal sound which precedes or follows it. When *t* is followed by *k* in the same syllable, as in *think*, *etick*, *etick*, the combination forms two distinct sounds—*surd* or breathed, as in *think*, and *sonant* or vocal, as in *etick*. These sounds were represented by two characters in Anglo-Saxon and Old English, and it is a pity the old letters were given up. The letters *n* before a vowel, and unaccented, usually pass into the sound of *at*, as in *nation*, *motion*, *partial*, which are pronounced *nasation*, *mosation*, *pasation*. In this case *t* loses entirely its proper sound or use, and being blended with the subsequent letter a new sound results from the combination, which is in fact a simple sound. If *s* or *x* precedes *t* (as in *mansion*, *question*), *t* retains its own sound, though in this case many speakers soften it to *at* as in *church*, as they also do in such words as *mixture*, *posture*. In comparing words common to the Indo-European tongues we find that (as formulated by Grimm's law) *t* in English (as also in Dutch, Icelandic, Gothic, &c.) corresponds to *d* in Latin, Greek, and Sanskrit, and to *s* or *z* in German. Thus *E. tooth* = *L. dens, dentis*, *Gr. odontos, (odontos)*, *Skr. dent, O. sahu, E. foot* = *L. pes (pedis)*, *pedis*, *Gr. podos, O. pado, E. just*; *E. two* = *L. duo, Gr. dyo, Skr. das, O. meri, E. to eat* = *L. edo, Gr. edo, Skr. ad, O. esera, and so on. An s before t, however, hinders this change from taking place, and hence the *t* in *E. stand* appears also in *L. sto, Gr. Astinai, and G. stehen*. The English *th*, on the other hand, answers to *t* in Latin, Greek, and Sanskrit, and to *d* in German; thus *E. three* = *L. tres, Gr. treis, Skr. tri, O. drem*. Hence it comes that *G. tag* = *E. day*; *gut* = *good*, *wasser* = *water*, and *zahn* = *tooth*. In some Latin words *d* has been changed to *t*, hence *t* in *E. tear* (*n.*) = *L. lacrima* (for *lacrima*), *Fr. larme*, a *tear*. A final *t* has become attached to many English words to which it does not properly belong, this being particularly the case after *n* and *s*, as in *tyrant*, *phantasm*, *ancient*, *amidst*, *asked*, *against*, &c. It has sometimes dropped out, as in *best*, *last*; so *th* has disappeared from *wordship*. This letter is often doubled in the middle of words, seldom at the end, as in *butt*, *mitt*. *T* is often used to denote things of this form, as the *T* palace in Mantua. See **T-BANDAGE**, **T-BEARD**, **T-CLOTH**, **T-IDON**, **T-JOINT**, **T-SQUARE**. To a *T*, exactly, with the utmost exactness; as, to suit or fit to a *T*. The allusion is to a mechanic's *T-square*, by which accuracy in making angles, &c., is secured. [Familiar.]*

We could manage this matter to a *T*. *Spenser.*

It was worn over the body armour, and was generally emblazoned with the arms of the wearer or of his lord. At first the tabard was very long, reaching to the mid-leg, but it was afterwards made

shorter, and was afterwards made of a morbid state of the plant. It is highly valued in the East Indies as a tonic, and as such is often chewed along with betel. It is used also in cases of bilious vomitings, bloody flux, piles, &c. Its optical properties are peculiar, inasmuch as it exhibits the lowest refracting power of all known substances. In the common tables of logarithms the logarithms of all numbers from 1 to 10,000 can be found by inspection, but by the aid of the *tabular differences* the logarithms of numbers between 10,000 and 1,000,000 may be found. Its prevailing colours are white, apple-green, and yellow. There are three principal varieties of talc, *common*, *earthy*, and *indurated*. It is used in many parts of India and China as a substitute for window-glass; indurated talc is used for tracing lines on wood, cloth, &c., instead of chalk. Talc is met with in several parts of Scotland, chiefly in connection with serpentine, and on the Continent. Several varieties are found in India and Ceylon.—*Oil of talc*, a name given by old writers to an alchemical nostrum famous as a cosmetic, considered as a substitute for and superior to ceruse. The name of a weight and denomination of money among the ancient Greeks, and also applied by Greek writers and their translators to various standard weights and denominations of money of different nations the weights and values differing in the various nations and at various times. The Attic talent was a weight contained 90 Attic minas, or 6000 Attic drachmas equal to 60 lbs. 13 oz. Eng. but Troy weight. As a denomination of silver money it was equal to 240 lbs. The Greek talent of the Romans is computed to be equal to 250 lb. of sterling and the little talent to 27½ sterling. A Hebrew weight and denomination of money equivalent to 2500 shekels, also received this name. As a weight, therefore, it was equal to about 250 lbs. avoirdupois, to a denomination of silver it has been variously estimated at from £260 to £280, the higher value being that given by the latest authorities.—2. A gift, endowment, or faculty some peculiar faculty, ability or qualification natural or acquired. "Wis. knowledge, or any other talent bestowed." *Adams.*

It is chiefly to be considered in its three different senses, as a coin, a measure, and a writer of tales. *Drayton.*

3. Mental endowments or capacities of a superior kind, general mental power used in this sense either in singular or in plural, as a man of talents, a man of great talent. This and the previous application of the word are probably borrowed from the scriptural parable of the talents. *Mat. xxv.* "The arbitrator of talent." *Coleridge.* "All the real talent and resolution in England." *Stout.*

**Talented** (tāl-ent-əd), *a.* Furnished with talents or great mental powers, possessing talents or endowments. (This word, as shown by the first quotation below, was introduced long ago, but seems not to have been in common use till quite recent times.

Coleridge and others have strongly objected to it (the former calling it a "rude and barbarous vocable"), but without any good reason. The chief objection to it has been that it is a pseudo-participle, a participle without a verb corresponding to it, but there are many words of exactly analogous formation in quite good usage compounded, lettered, furrowed, bearded, clappered, landed, &c. Mr. Finsward Hall instances outlandish and unlanded from Richardson.]

What a miserable and revolting thing ambition is, when one depends but on a common person, yet, by the favour of his prince, hath gotten that honour, that is a man all the boys of England hang at his heels. *Shp. John 1:10-11.*

The way in which talented and many of its fellows are very frequently used shows that these words, to the consciousness of our society, began with being strictly participles. At present they have the function of participial adjectives, and, when between their substantive function and their literary they are, therefore, to be considered, as adjectives, as developments from ideal verbs. The things in which they are formed, further as well established, that, whenever I observe degraded in his name, more consciousness is quite ground enough in justice as in coming terms on the same model whenever they may be really repeated.

The straight cylindrical trunk which rises sometimes to the height of 70 or even 100 feet, is crowned with a tuft of enormous fan-like leaves, usually about 15 feet long and 14 feet broad, composed of from 50 to 100 radiating segments plaited like a fan till near the extremity. These leaves are used for covering houses, making umbrellas fans, and frequently used as a substitute for writing paper. At the age of thirty or forty years or more the tree

dies, and after producing fruit grows again. The flower-spikes, 30 feet high and covered with white blossoms, is a beautiful object.

1. A piece of wood on which notches or scores are cut, as the marks of number. In purchasing and selling it was customary for traders to have two sticks, or one stick cleft into two parts, and to mark with scores or notches on each the number or quantity of goods delivered, or what was due between debtor and creditor, the seller or creditor keeping one stick, and the purchaser or debtor the other. Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In the exchequer tallies were formerly used, which answered the purpose of receipts as well as simple records of matters of account. Hence the origin of exchequer bills. In former times of financial difficulty, from the period of the Norman conquest the practice had been to issue exchequer tallies. An exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches, indicating the sum for which the tally was an acknowledgment. On two other sides opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction, were written by an officer called the writer of the tallies. This being done the rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the counterstock, was kept in the exchequer, and the other, the stock, only issued. When the part issued was returned to the exchequer (usually in payment of taxes) the two parts were compared, as a check against fraudulent imitation. This ancient system was abolished by 25 Geo. III. lxxiii., and by 4 and 5 Will. IV. xv. all the old tallies were ordered to be destroyed. The size of the notches made on the tallies varied with the amount. The notch for £100 was the breadth of a thumb; for £1 the breadth of a barleycorn. A penny was indicated by a slight slit.—2. Anything made to suit or correspond to another.

It is very soluble in water, and has a most astringent taste, without bitterness. It combines with animal gelatine, forming an insoluble curdy precipitate which has been called *tannogelatin*. **Tanning** (tan'ing) *n.* 1. The practice, operation and art of converting the raw hides and skins of animals into leather by effecting a chemical combination between the gelatine of which they principally consist and the astringent vegetable principle called tannic acid or *tannin*. The object of this tanning process is to produce such a chemical change in skins as may render them unalterable by those agents which tend to decompose them in their natural state and in connection with the subsequent operations of carrying or dressing to bring them into a state of pliability and impermeability to water which may adapt them for the many useful purposes to which leather is

applied. The larger and heavier skins subjected to the tanning process, as those of buffaloes, bulls, oxen, and cows, are technically called *hides*; while those of smaller animals, as calves, sheep, and goats, are called *skins*. After being cleared of the hair, wool, and fleshy parts, by the aid of lime, scraping, and other means, the skins are usually steeped in an infusion of ground oak bark, which supplies the astringent or tanning principle, and thus converts them into leather. Different tanners, however, vary much in the mode of conducting the process of tanning, and also the skins intended for different kinds of leather require to be treated differently. Various improvements have been made in the process of tanning, by which time and labour are much reduced; but it is found that the slow process followed by the old tanners produces leather far superior to that produced by quick processes.—2. Appearance or hue of a brown colour produced on the skin by the action of the sun.

A thick, dark-coloured, viscid product obtained by the destructive distillation of organic substances and bituminous minerals, as wood, coal, peat, shale, &c. Wood-tar, such as the Archangel, Stockholm, and American tars of commerce, is generally prepared by a very rude process. A conical cavity is dug in the ground, with a cast-iron pan at the bottom, from which leads a funnel. Billets of wood (such as pine or fir) are thrown into this cavity, and being covered with turf are slowly burned without flame. The tar which exudes during combustion is conducted off through the funnel. In this country wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vinegar (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, &c., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in Britain in the process of gas manufacture. It is a very valuable substance, in as much as the compounds obtained from it form the starting-points in so many chemical manufactures. See *COAL-TAR*. — 2. A sailor: so called from his tarred clothes, hands, &c. 'Hearts of oak are our ships, jolly tars are our men.' See *song*.

It exists in grape juice, in tamarinds, and several other fruits, but principally in bitartrate of potassium, or cream of tartar, from which it is usually obtained. It crystallizes in large rhombic prisms, transparent and colourless, and very soluble in water. It is inodorous, and very sour to the taste. A high temperature decomposes it, giving rise to several new products. The solution of tartaric acid acts with facility upon those metals which decompose water, as iron and zinc. Tartaric acid is dibasic, its salts are called *tartrates*. Tartaric acid has a most remarkable disposition to form double salts, as the tartrate of potassium and sodium or Rochelle salt; the tartrate of potassium and antimony, or tartar emetic. There are five modifications of tartaric acid, characterized chiefly by the difference in the action exerted by them upon a ray of polarized light, such as dextro-ordinary tartaric acid, levo-tartaric acid, para-tartaric or racemic acid, meso-tartaric acid, and meta-tartaric acid. Tartaric acid is largely employed as a discharge in calico-printing, and for making soda-powders. In medicine it is used in small doses as a refrigerant.

1. The perception, or the power of perceiving and relishing excellences in human performance, the faculty of discerning beauty, order, congruity, proportion, symmetry, or whatever constitutes excellence, particularly in the fine arts and literature, that faculty of the mind by which we both perceive and enjoy whatever is beautiful and sublime in the works of nature and art, the perception of these two qualities being attended with an emotion of pleasure.

What then is Taste but those internal powers, Active and strong, and feelingly alive To such fine impulses? A discerning sense Of decent and sublime, with quick discernment For things deform'd, or distinguished, or gross In species!

Taste, if it means anything but a glibly conventional, dry, dead, and general susceptibility to truth and falsehood, a sense to discern, and a heart to love and reverence all beauty, order, goodness wherever or in whatever forms and circumstances they are to be seen.

Carlyle.

2. Manner, with respect to what is pleasing; the pervading air, the choice of circumstances, and the general arrangement in any work of art, by which taste in the artist or author is evinced, style, as, a poem or music composed in good taste.

Consider the exact sense in which a work of art is said to be in good or bad taste. It does not mean that it is true or false, that it is beautiful or ugly, but that it does or does not comply either with the law of choice, which are enforced by certain modes of life, or the habits of mind produced by a particular sort of education. It does not mean merely fashionable, that is, complying with a momentary caprice of the upper classes, but it means agreeing with the habitual sense which the most refined education common to those upper classes at the period gives to their taste mind.

Ruskin.

I hope, for my brother's justification, he wrote this as an essay or taste of my views.

The use of tea in this country dates from the middle of the seventeenth century. The following advertisement appeared in the *Mercurius Politicus* of Sept. 30, 1668. 'That excellent and by all physicians approved China drink called by the Chinese *Tcha*, and by other nations *tea*, alias *tee*, is sold at the Sultana Head Coffee House, London.' An entry of Pepys's *Diary* in 1660 runs: 'I did send for a cup of tea, a China drink, of which I had never drunk before.' After the Reformation the whole teinds of Scotland were transferred to the crown, or to private individuals called titulars, to whom they had been granted by the crown, or to feuars or renters from the church, or to the original founding patrons, or to colleges or pious institutions. By a succession of decrees and enactments these tithes were generally rendered redeemable at a fixed valuation, but the clergy have now no right to the teinds beyond a suitable provision, called a stipend; so that teinds may now be described as that portion of the estates of the laity which is liable to be assessed for the stipend of the clergy of the Established Church. As a fund for the stipends of clergyman teinds are under the administration of the Court of Session. — *Court of teinds*, a court in Scotland, otherwise called *Commissioners of Teinds*. **Telegram** (tê'lê-gram), *n.* [Gr. *têlê*, far, and *gramma*, what is written, from *graphô*, to write. The word is said to have been coined in America in 1862, and Greek scholars objected to it as barbarous. *Graphô*, when compounded with anything but a preposition, becomes *graphê*; therefore, compounded with *têlê*, the verb would be *têlê-graphê*, and the noun from it *telegraphêma*, the English representative of which would be *telegrapheme*. The superior compactness of the illicit word, however, and the analogy of such forms as *chronogram*, *logogram*, *monogram*, enabled it to carry the day.] A communication sent by telegraph; a telegraphic message or despatch.

It is astonishing to see how rapidly a word is formed and takes root, if it expresses something of the so-called business of life. We all remember the introduction of the word *telegram* during the Crimean war, as distinguished from *telegraph*, which had previously, though certainly not etymologically, been used in both significations. *Chambers's Journal.*

And then there is, as against the exact, but surfeiting 'telegrapheme,' our lawless *telegram*, to which is strictly applicable the maxim of the civilians, as regards a clandestine marriage: '*Fieri non debuit, sed factum, valet.*' *Fitzedward Hall.*

— To *milk* a telegram, surreptitiously to make use of a telegram designed for another. [Slang.]

**Telegrammic** (tê'lê-gram'ik), *a.* Of or pertaining to a telegram; having the characteristics of a telegram; hence, brief; concise; succinct. [New and rare.]

**Telegraph** (tê'lê-graf), *n.* [Gr. *têlê*, far, at a distance, and *graphô*, to write.] 1. A general name for any instrument or apparatus for conveying intelligence beyond the limits of distance at which the voice is audible, the idea of speed being also implied. Thus the name used to be given to a semaphore or other signalling apparatus. The word, however, is now usually restricted in its application to the electric telegraph, which from its power of rapidly conveying elaborate communications to the greatest distances has thrown all others into the shade. The electric telegraph, as comprising the entire system of apparatus for transmitting intelligence by electricity, consists essentially (1) of a battery or other source of electric power; (2) of a line-wire or conductor for conveying the electric current from one station to another; (3) of the apparatus for transmitting, interrupting, and if necessary reversing the current at pleasure; and (4) of the indicator or signalling instrument. For the chief forms of battery in use see under GALVANIC. The line-wires for overhead lines are usually of iron, protected from atmospheric influence by galvanizing or by being varnished with boiled linseed-oil, a coating of tar, or other means, and are supported upon posts, to which they are attached by insulators. (See INSULATOR.) In underground lines the wires are insulated by a gutta-percha or other non-conducting covering, and inclosed in iron or lead pipes. A description of the line-conductor in submarine telegraphs will be found under CABLE. The battery and line-wire are common to all telegraphic systems; it is in the method of producing the signals that the great variation exists; but in all of them advantage has been taken of one or other of the three following properties of the current: (1) its power of producing the deflection of a magnetic needle, as in the galvanometer (which see); (2) its power of temporarily magnetizing soft iron; and (3) its power of producing chemical decomposition. The *needle-telegraph* of Cooke and Wheatstone is an application of the first of these properties. In it a pair of needles is used, one of which, being magnetized, is placed within a multiplying coil, the other appearing on the dial of the instrument.

The plane of the coil is vertical; the needles hang on horizontal axes. The dial needle deflects its upper end to the right or left in accordance with the direction of the current, and it is by combinations of these deflections that the letters, &c., are formed. A double-needle telegraph, consisting of two single needle-instruments, has been used; but although it gives great increase of speed of transmission, from its expensiveness, requiring the maintenance of two systems of line-wires, it can never be popular. The needle-telegraph was never adopted out of England, and even here the Morse has been generally substituted for it. Its transmitting instrument is a reversing key, worked by a handle, which appears on the instrument below the dial-needle. The turning of this handle in one direction or the other gives rise to a current of electricity from the battery, which passes through the instruments of both receiver and sender. The attention of the receiver is called by the preliminary sounding of an electric bell. The *electro-magnetic* instrument of Professor Morse is an application of the second of the above properties. By means of an electro-magnet, an armature which is attracted when the magnet is temporarily magnetized, a lever moved by the armature, and a style which moves with the lever, this instrument impresses a message in dots and dashes on a ribbon of moving paper. (See MORSE-ALPHABET.) A modification of this instrument, called a *sounder*, in which the lever makes audible sounds by coming in contact with a brass rod, indicates the message by the length of the strokes produced. Frequently the Morse is simultaneously a recorder and sounder. It being necessary that this instrument should produce sharp and distinct impressions, and the current being weak for stages over 50 miles, a relay is added to it in the case of longer distances. (See RELAY.) The transmitting instrument is a lever, which, on being pressed, permits the current from the battery to flow into the line-wire during the time the contact is made. Both on account of its intrinsic merits and for the sake of uniformity the Morse is the most extensively used system, being that in use in America and on the Continent of Europe, and being also largely employed in Britain. Wheatstone's 'universal telegraph' is also one in extensive use. The currents employed are magneto-electric, and are alternately positive and negative. They produce successive reversals of polarity in an electro-magnet, which acts upon a light steel magnet and causes it to rotate through a large angle first in one direction and then in the opposite. Each of these rotations causes a ratchet-wheel to advance one tooth, and this causes the pointer to advance one letter. At the same time the turning of the handle by which the currents are generated causes the pointer of the sending instrument to advance one letter for each current sent, so that the pointers at the two stations indicate the same letter. The same dial which serves for sending also serves for receiving. It is surrounded by a number of keys or buttons, and when any letter is to be sent its key is depressed, the operator continuing all the while to turn the handle for generating currents. The *electro-chemical telegraph* of Alexander Bain of Edinburgh takes advantage of the third of the above-mentioned properties of the current. Upon a metallic disc, which is carried round by clockwork, is laid a sheet of paper, prepared by having been dipped in a solution of prussiate of potash, nitric acid, and ammonia, over which rests a screw-plate, serving to guide a pen, consisting of a piece of fine steel, connected with the positive pole of the battery, the metallic disc being connected with the negative. The transmitting instrument is that of Morse. When a current is transmitted it decomposes the prussiate of potash in passing through the moistened paper, and the acid, uniting with the iron style at the positive electrode, forms ferrocyanide of iron or Prussian blue, leaving a distinct blue trace upon the paper moving under it. There are many more instruments, modifications of one or other of the above. Instruments, as Hughes' telegraph, have been invented which print the message in Roman characters, but as yet they have been little used. *Autographic telegraphs*, by which writing or a design can be produced in facsimile have also been invented. Caselli's telegraph effects this end by the use of a

area or surface; hence a distant point, inappreciable by the eye alone, is rendered visible by the aid of the telescope. The rays of light, after transmission or reflection, converge to a point as they at first proceeded from a point, and thus an image of the object is formed which, when viewed by the eye-piece or lens, is more or less magnified. The telescope therefore assists the eye in these two ways: it gathers up additional light, and it magnifies the object; that is to say, its image. The *refracting telescope* is constructed of lenses alone, which, by successive refractions, produce the desired effect. This instrument was formerly very cumbersome and inconvenient, inasmuch as its length had to be increased considerably with every accession of power; and though the substitution of achromatic for ordinary lenses has rendered it more portable, its construction even at the present day does not enable it to compete with the reflecting telescope as an astronomical investigator. The *reflecting telescope* is composed of specula or concave reflectors, aided by a refracting eye-piece. To this instrument we owe the most wondrous discoveries in astronomical science. The names of Newton, Gregory, Herschel, and Lord Rosse are connected with its history. The following diagrams exhibit the principles of construction and action in both

Fig. 1.

sorts of telescopes. In fig. 1, which illustrates the refracting telescope in its simplest form, A and B are two lenses of different focal lengths. Rays of light from a distant object falling upon the object-glass A are converged to a focus at C. The eye-glass B, placed at its focal distance from the point of convergence, gathers up the diverging rays and carries them parallel to the eye, magnifying the image formed at C. The magnifying power of the instrument is as  $AO : OB$ , or as the focal length of one lens to that of the other. In this construction the object is inverted by the intersection of the rays, and hence it is unsuitable for terrestrial purposes. To render the image erect a more complicated eye-piece, consisting of two additional lenses, is necessary. Fig. 2 shows

Fig. 2.

the structure of the reflecting telescope as constructed by Dr. Gregory. AB is a large speculum perforated in the centre; upon this fall the rays b, a and d, c, which are reflected to convergence at e. A smaller speculum, c, takes up the diverging rays and reflects them, slightly converging, through the aperture o, where they are received by a lens, and, after transmission, they intersect at x, and proceed to the eyeglass, whence they emerge parallel. The magnifying power of this instrument is great for its length, being as  $oe \times xC$ . In the

telescope invented by Sir Wm. Herschel there is no second speculum, and no perforation in the centre of the larger one placed at the bottom of the tube. The latter is fixed in an inclined position so that the image formed by reflection falls near the lower side of the tube at its open end or mouth, where it is viewed directly by an eye-piece without greatly interfering with the light. This arrangement, in the case of large reflectors, is imposed by their great weight and difficult management. Were it otherwise the ordinary construction would be preferred, the inclination of the speculum being a disadvantage. Chromatic aberration, which arises from the different refrangibilities of the various coloured rays, and leads to the formation, by a lens, of a separate image of a bright object for each coloured ray, is remedied by achromatizing the

lens, that is, by constructing it of two or more lenses of different kinds of glass, so that the colours, separated by one, shall be reunited by the others. See ACHROMATIC. — 2. Same as *Telescopium*. — *Prism telescope*. See TRINOSCOPE.

Many *temperaments* and explanations there would have been if ever I had a notion that it (a paupier) should meet the public eye.

Auricular confession. . . an imperative duty in the Church of Rome, and preserved as such in the six articles, and in the codes published by Henry VIII., was left to each man's discretion in the new order; a judicious *temperament* which the reformers would have done well to adopt in some other points.

3. That individual peculiarity of physical organization by which the manner of acting, feeling, and thinking of each person is permanently affected. The ancients distinguished four temperaments, which derived their names from the fancied excess of one or other of the principal humours or fluids of the body; as, the *choleric* or bilious, from *Gr. chole*, bile; the *phlegmatic*, from *phlegma*; the *melancholic*, from *melaina*, black, and *cholê*, bile; and the *sanguine*, from *L. sanguis*, blood. Many modern authorities have adopted a classification indicative of the fulness of habit and relative activity of the nutritive functions, and cerebro-spinal activity, employing the terms *sanguineous*, *nervous*, *nervo-sanguineous*, *sanguineo-nervous*, *lymphatic*, and *phlegmatic*. Dr. Cullen and others admit of only two temperaments, the sanguine and the melancholic, considering the phlegmatic a degree of the sanguine, and the choleric of the melancholic; and many of the so-called temperaments, as the bilious, melancholic, and lymphatic have been looked upon merely as departures from health, the result of imperfect development, incorrect habits, bad nutrition, and inactive functions of the body, which may be modified or removed by corrected habits, regimen, or medical treatment.—4. Condition as to heat or cold; temperature. 'In proportion to the fertility of the soil and the *temperament* of the climate.' *Cook.*

Bodies are denominated hot or cold in proportion to the present *temperament* of our body to which they are applied. *Locke.*

5. In *music*, a certain adjustment or regulation of the tones or intervals of the scale of fixed-toned instruments, as the organ, piano, and the like, with the view of removing an apparent imperfection, and fitting the scale for use in all keys without offence to the ear. The intervals between the notes of the natural scale are by no means equal. Thus, sup-

posing the perfect octave to be divided into fifty-three equal parts, or *commas* as they are technically called, and taking C as the key-note or tonic, the intervals between the notes would be made up as follows: C to D, 9 commas; D to E, 8; E to F, 5; F to G, 9; G to A, 8; A to B, 9; B to C, 5. We have here three species of intervals, of which those represented by 9 are called major tones; those by 8, minor tones, and those by 5, major semitones. A fixed-toned instrument tuned on this principle would fully satisfy the ear with the correctness of its tones and the richness of its concords while the key of C was adhered to. But if we start, say, from D as a key-note, the proportions of the scale, or the sequence of the major and minor tones and of the semitones, are destroyed. D to E would form a tolerable, though not absolutely correct second, but the third and seventh of the scale would be entirely wrong. Were the major and minor tones equal, and each semitone exactly half a tone, the insertion of a note between each full tone, exactly dividing the intervals between them, would give an ideally symmetrical scale, and it would be immaterial where the scale began, as each of the twelve notes would be available as a key-note. Now, though such an equality is contrary to the principles of harmonics, an adjustment or arrangement of the sounds of fixed-toned instruments founded on it gives practically no offence unless to the critical ear. In what is termed *equal* or *even temperament*, which is now, theoretically at least, adopted for all pianos, organs, harmoniums, &c., the twelve semitones are all adjusted so as to stand at intervals of the same length, and thus no advantage is given to one key over another. In the *unequal* or *vulgar temperament*, formerly adopted for organs, some popular keys, as Bb, F, C, G, and D, were favoured at the expense of the rest, that is, the true intervals of the normal or natural scale were pretty closely adhered to; but the harsh fifths and thirds (the 'Wolf tones' of musicians) occurring in the keys written in several flats or sharps caused this system to be abandoned. The different characters of the various keys recognized on most fixed-toned instruments could have no existence were equal temperament absolutely adhered to, and are due to the fact that some discrimination is still practically used in favour of certain popular keys, though not to such an extent as to injure very sensibly the effect of keys less favoured. The only instruments of orchestral importance capable of producing just intonation, or of being played in perfect tune, are those of the violin family, which in this respect approach the perfection of the human voice; and were not a habit of incorrect intonation too often acquired by performing to the accompaniment of tempered instruments, the skillful singer or violinist could produce his notes in true key relationship through the most intricate modulations or changes of key.

The basis on which these associations have generally been formed has been that of an engagement on the part of each member to abstain from the habitual and improper use or indulgence in intoxicating liquors. 2. Mixture or that which is made by mixture, a compound. Made a temperature of brass and iron together. *Hallam*. 'A proper temperature of fear and love'. *Asp. Junior*. - 3. Temper of metals. 'The due temperature of stiff steel'. *Hallam*.

2. Moderate degree of atmospheric heat, temperature of climate. 'If instead of this variation of heat we suppose an equality or constant temperature of it before the deluge'. *Woodward*. - 4. The state of a body with regard to heat, the degree or intensity of the heat effect of a body, the thermal state of a body considered with reference to its power of communicating heat to other bodies. When two bodies are in contact, and the flow of heat from the one body to the other is equal, that is, when by contact neither is heated or cooled by the other - they are said to be of the same temperature. Two bodies may have the same temperature and yet contain very different quantities of heat per unit of mass, so that the temperature of a body is not a measure of its heat. If heat be considered as a motion of the molecules of a body temperature may be considered a measure of the velocities of the molecules. When we speak of a body having a 'high' or a 'low' temperature it is implied that the condition of heat in the body may be compared with some standard. The means of such comparison in the thermometer and the most convenient standard condition is apparently that of a body at the melting point of ice which is marked on the Centigrade thermometer scale and on Reaumur's as zero. See TEMPERATURE. - 5. Animal temperature, the degree or intensity of heat of animal bodies. This varies considerably with the classes of animals, thus the average temperature of mammals is stated at 101° Fahrenheit, that of birds, at 107°. Below mammals and birds animals are termed cold-blooded, this term meaning in its strictly physiological sense that the temperature is usually that of the medium in which they live and that it varies with that of the surrounding medium. The average normal temperature of the human adult is about 98° F., but in some cases of disease, as fever, it may rise to 100°, 107°, or even as high as 115° while in other cases, as during cholera and Asiatic cholera, it may fall as low as 77° F. - 6. Mean temperature, a mean of all the atmospheric temperatures observed at a given place or under certain circumstances at regular intervals during a certain space of time. The mean annual temperature of any place is obtained by taking a mean of all the temperatures indicated by the thermometer each day throughout the year. The temperature of a place depends not only on its latitude, but also on its elevation above the level of the sea, and various other local causes such as the nature of the soil, the prevailing winds, the quantity of moisture, the electric state of the atmosphere, and the physical character of the adjacent countries and seas. But no cause has such an effect in lowering the temperature of a place as elevation above the level of the sea and hence near the equator there are mountains which, owing to their great elevation, are covered with snow all the year round. (See SNOW LINE.) The temperature of the sun is more uniform and moderate than that of the land.

Tempering (tem'pə-ſing), n. The process of giving the requisite degree of hardness or softness to a substance, as to iron or steel, especially the process of giving to steel the different degrees of hardness required for the various purposes to which it is applied. The process essentially consists in plunging the steel when red hot into cold water or other liquid to give an extreme of hardness, and then gradually reheating it until the hardness is reduced or brought down to the required degree. The excellence of all cutting steel instruments depends on the degree of temper given to them. Different degrees of temper are indicated by different colours which the steel

assumes. Thus steel heated to 450°, and suddenly cooled, assumes a pale straw colour, and is employed for making razors and surgical instruments. See STEEL.

Templar (tem'plar), n. 1. One of a religious military order first established at Jerusalem in favour of pilgrims travelling to the Holy Land. The order originated with some persons who in 1118, devoted themselves to the service of God, promising to live in perpetual chastity, obedience, and poverty, after the manner of canons. Baldwin II, king of Jerusalem, bestowed on them their first place of residence in the city, close to the Temple, and an additional building was acquired from the abbot and canons of the church and convent of the Temple, whence the order received the name of Templars - Monks in the 'poor soldiers of Temple Church, London.

The Temple' afterwards converted into Templars, or Knights Templars. The knights wore a white cloak adorned with a red cross of eight points (the

Maltese cross) on the left shoulder. In 1199 this order was confirmed in the Council of Troyes, and subjected to a rule of discipline. Temple (tem'pl), n. [Fr. *temple*, from L. *templum*, a temple, originally a place marked off or cut off, properly a piece marked off by lines which the augurs traced for their observations, then a place of land marked off from common use, and dedicated to a god, from root *tem* in *temere*, to cut, whence *temere* (temerous, a temple) 1. An edifice dedicated to the service of some deity or deities, and connected with some pagan system of worship, originally, an edifice erected for some Roman deity, but the term is generally applied to such edifices among the Greeks, Egyptians and other ancient nations as well as to structures serving the same purpose among modern heathen peoples. The most celebrated and imposing of the ancient temples were those of the Greeks, such as that of Artemis or Diana at Ephesus, that of Zeus Olympus in Athens, and that of Apollo at Delphi. The form most generally given to the ancient temples was that of a rectangle, but sometimes the construction was circular. Vitruvius divides temples into eight kinds, according to the arrangement of their columns, viz. temples in *antea* (see *ANTEA*), *pronaos*, *amphiproraos*, *peripteris*, *dipteryx*, *pseudodipteryx*, *hypæthral*, and *monoperteryx* (See these terms.) Of circular temples there are two species, the *monoperteryx*, without a cell, and the *peripteris*, with a cell. 2. The second was constructed by the Jews on their return from the captivity about 536 B.C. and was pillaged or partially destroyed several times, as by Antiochus Epiphanes (170 B.C.), Pompey (63 B.C.), Herod (37 B.C.). **Tenuis** (ten't-ee), *n.* One of the Tenuis

**Tenuity** (ten't-ee-tee), *n.* [L. *tenuitas*, from  
*tenuis*, thin. See *TEN*] 1. The state of  
being tenuous or thin; thinness, smallness  
in diameter, utility, thinness, applied to a  
broad substance, and slenderness, applied  
to one that is long, as, the tenuity of paper  
or of a leaf, the tenuity of a hair or filament.  
2. Rarety, rareness, thinness, as of a fluid,  
as, the tenuity of the air in the higher re-

gions of the atmosphere; the tenuity of the  
blood. — 3. Poverty.

The tenuity and contempt of chryseion will soon  
let them see what a poor creature they are, when  
puffed from the influence of that supremacy.  
*Eden Barwick.*

4. Simplicity or plainness, a quality of style

**Tenuous** (ten't-ee-us), *a.* [L. *tenuis*, thin.]

tinued effluvia.' *Sir T. Browne.*

**Tenure** (ten'ter), *n.* [Fr. *tenure*, L. *tenere*,  
from L. *tenere*, to hold.] 1. The act, manner,  
or right of holding property, especially real  
estate. Land may be held according to two  
main principles, the tenure being either  
*feudal* or *allodial*. According to the latter  
tenure, the whole right and title of the  
land rests with the owner according to the  
former, the person possessing the subject  
holds it from a superior, and this is the prin-  
ciple universal in England. According to  
the theory in England all land is held of the  
crown, either mediately or immediately.  
The ownership of land is therefore never  
unlimited as to extent, for he who is the  
owner of land in fee, which is the largest  
estate that a man can have in land, is not  
absolute owner, he owes services in respect  
of his fee (or fee), and the signatory of the  
lord always subsists. All land in the hands  
of any layman is held of some lord, to whom  
the holder or tenant owes some service, but  
in the case of church lands, although they  
are held by tenure, no temporal services are  
due, but the lord of whom these lands are  
held must be considered the owner, al-  
though the beneficial ownership can never  
revert to the lord. All the species of an-  
cient tenures may be reduced to four, three  
of which subsist to this day. — (1) *Tenure by  
knight service*, which was the most honour-  
able. This is now abolished. (2) *Tenure in  
free socage*, or by a certain and determi-  
nate service, which is either free and  
honourable, or villenage and base. (3) *Tenure  
by copy of court roll*, or *copyhold tenure*.  
(4) *Tenure in ancient demesne*. There was  
also tenure in frankfeudalism, or free alms.

The tenure in free and common socage has  
absorbed most of the others. (See *TENANT*,  
*COPYHOLD*, *SOCAGE*, *VILLAGE*.) In Scots  
law the equivalent technical term is *holding*.

2. The consideration, condition, or service  
which the occupier of land gives to his lord or  
superior for the use of his land. — 3. Manner  
of holding in general, the terms or condi-  
tions upon which anything is held or re-  
tained, as, in absolute governments men  
hold their rights by a precarious tenure.

Reading is the charge in the gun shinning along  
to note the surface of the ground as to place the  
lives of the dogs on a rather uncertain and precat-  
ory tenure. *Dudman.*

the wings having, in order to the future development of the insect, transverse scars across the roots, dividing the nervures. These insects when mature leave the hive and fly abroad, afterwards shedding the wings by means of the seams referred to, and becoming the kings and queens of future colonies. The soldiers and workers, both neuter, or of no fully developed sex, and differing merely in the armature of the head, are distinct animals from the moment they leave the egg, the young differing from the adult of the same class only in size. The duties of the workers are to build the habitations, make covered roads, nurse the young, attend on the king and queen, and secure the exit of the mature winged insects, while to the soldiers, whose mandibles are powerfully developed for that purpose, is committed the defence of the community, which duty they perform with both system and desperate courage. The earlier geologists used this term as designating all strata above the secondary; but later discoveries have tended to modify its sense by way of restriction. As now employed the term *tertiary formation* designates the rock-system extending from the chalk (the highest member of the secondary), on which it rests, to the base of the post-tertiary system, which latter, according to some, includes the strata belonging to the glacial epoch, while others leave them in the tertiary. It is noteworthy that there is a complete and entire physical break between the rocks of the secondary or mesozoic and tertiary periods, the latter resting in no instance conformably on the former, while there is an equally complete break in the life of the two periods, not a single secondary animal or plant being known to have survived the cretaceous period with the exception of a few Foraminifera. In the tertiary rocks, on the other hand, not only are all the animals and plants more or less like existing types, but we meet with a constantly increasing proportion of living species as we pass from the bottom to the top. The classification of the tertiary formation is based on this increase, the strata being divided into two great groups as follows:— (1) *THE OLDER TERTIARY*, comprising the *Eocene*, with five per cent of living species, and the *Miocene*, with twenty-five per cent. (2) *THE NEWER TERTIARY*, comprising the *Older Pliocene*, containing fifty per cent of living species, and the *Newer Pliocene*, containing ninety-five per cent.

**Thamnophilinae** (tham'nó-fil-ī'nē), *n. pl.* The bush-shrikes, a sub-family of dentirostral passerine birds, family Laniidae or shrikes. See **SHRIKE**.

**Than** (THAN), *conj.* [A. Sax. *thenne*, *thanne*, *thonne*, than, then, the latter being the original meaning. This word is therefore the same as *then*; so that 'this is better than that' is equivalent to 'this is better, then that'.] A particle used after certain adjectives and adverbs which express comparison or diversity, such as *more*, *better*, *other*, *otherwise*, *rather*, *else*, and the like, for the purpose of introducing the second member of the comparison. *Than* is usually followed by the object compared in the nominative case, but sometimes the object compared is placed in the objective case, and the particle is then considered by some grammarians as a preposition. 'Thrice fairer than myself.' *Shak.*

Among them that are born of women there hath not risen a greater *than* John the Baptist; notwithstanding that is least in the kingdom of heaven is greater *than* he. *Ja. xi. 11.*

Thou art a girl as much brighter *than* her, as he is a poet sublimer *than* me. *Prior.*

A tragedy *than* which, since the days of the ancients, there had been nothing more classic or elegant. *Thackeray.*

The object or second member of comparison coming after *than* is often a clause with *that* introducing it; as, I had rather be a sufferer myself *than* that you should be. Or *that* may be omitted, in poetry at least.

Since I suppose we are made to be no stronger *Than* faults may shake our frames. *Shak.*

**Than** (THAN), *adv.* Then. *Shak.*

**Thanatopsis** (than-a-top'is), *n.* [Gr. *thanatos*, death, and *opsis*, a view.] A view or contemplation of death. *Bryant.*

**Thane** (thán), *n.* [A. Sax. *thegen*, *thegn*, *thén*, a soldier, an attendant, a servant of the king, a minister, a nobleman; Icel. *thegen*, a brave man, freeman, warrior; O.H.G. *degan*, a soldier, male, disciple. Same root as obsolete verb *to the* or *thee*.] A title of honour among the Anglo-Saxons. In England a freeman not noble was raised to the rank of a thane by acquiring a certain portion of land—five hides for a lesser thane—by making three sea voyages, or by receiving holy orders. Every thane had the right of voting in the witenagemot, not only of the shire, but also of the kingdom, when important questions were to be discussed. With the growth of the kingly power the importance of the king's thanes (those in the personal service of the sovereign) rose above that of the highest gentry, ealdormen and bishops forming an inferior class. On the cessation of his actual personal service about the king the thane received a grant of land. After the Norman conquest thanes and barons were classed together. In the reign of Henry II. the title fell into disuse. In Scotland the thanes were a class of non-military tenants of the crown, and the title was in use till the end of the fifteenth century. The notion derived from Boece, and adopted by Shakespeare in 'Macbeth', that the Scotch thanes were all transformed into earls, has no historical foundation.

**Thanedom** (thán'dum), *n.* The district or jurisdiction of a thane.

Rarely met with in the south, *thanedoms* are found mostly in Angus and Mearns and the northern shires down to the Moray Firth. We must not expect to find them in the fertile plains of the Lowlands, which were speedily and entirely occupied by the southern settlers, become feudal barons, nor yet in the laner fastnesses of the mountains, where the Celtic institutions, unmodified, excluded the Saxon title or office. *Corno Innes.*

**Thanehood** (thán'hód), *n.* 1. The office, dignity, or character of a thane.—2. Thanes

in general; the collective body of thanes. *J. K. Green.*

**Thane-land** (thán'land), *n.* Land granted to thanes.

*Thane-lands* were such lands as were granted by charters of the Saxon kings to their thanes with all immunities, except the threefold necessity of expedition, repair of castles, and mending of bridges. *Cowell.*

**Thaneship** (thán'ship), *n.* The state or dignity of a thane; the seigniority of a thane.

**Thank** (thank), *v. t.* [A. Sax. *thancian*, to thank, from the noun *thanc*, thanks; G. *danken*, to thank. See the noun.] To express gratitude to for a favour; to make acknowledgments to for kindness bestowed.

Heavens *thank* you for't. *Shak.*

You shall find yourself to be well *thank'd*. *Shak.*  
When I'm not *thank'd* at all I'm *thank'd* enough, I've done my duty, and I've done no more. *Filding.*

The word is often used ironically.

Weigh the danger with the doubtful bliss,  
And *thank* yourself if aught should fall amiss. *Dryden.*

—*I will thank you*, a colloquial phrase of civility introducing a request, equivalent to, will you oblige me by doing or by giving or handing me; as, *I will thank you* to shut the door, *I will thank you* for the mustard, and the like.—*Thank you*, a colloquial or informal contraction of the phrase *I thank you*, which would be considered somewhat stiff and formal perhaps as a simple expression of politeness in ordinary circumstances. *Thank you*, or *I thank you*, is often used in declining an offer or request, both seriously and ironically.

Will't please your worship to come in, sir?  
No, *I thank you*, forsooth, heartily. *Shak.*

**Thank** (thank), *n.* [A. Sax. *thanc*, *thone*, acknowledgment for a favour, thanks, approbation, also thought, mind, will; Goth. *thagke*, Icel. *thökk*, D. and G. *dank*, thanks, from stem of *think*.] 1. Expression of gratitude; an acknowledgment made to express a sense of favour or kindness received: now used almost exclusively in the plural.  
If ye love them which love you, what *thank* have ye? *Luke vi. 32.*

A yellow eyelid falls  
And closed by those who mourn a friend in vain,  
Not *thankful* that his troubles are no more. *Tennyson.*

2. Expressive of or by way of thanks. 'A *thankful* sacrifice.' *Shak.*—3. Claiming or deserving thanks; meritorious; acceptable.

Ladies, look here; this is the *thankful* glass  
That mends the looker's eyes; this is the well  
That washes what it shows. *G. Herbert.*

—*Grateful*, *Thankful*. See under **GRATEFUL**.

**Thankfully** (thank'ful-ly), *adv.* In a thankful manner; with a grateful feeling on account of a favour or kindness received.

**Thankless** (thank'les), *a.* 1. Unthankful; ungrateful; not acknowledging favour.

That she may feel  
How sharper than a serpent's tooth it is  
To have a *thankless* child. *Shak.*

2. Not deserving thanks or not likely to gain thanks; as, a *thankless* task.

The contracting and extending the lines and sense of others, if the first authors might speak for themselves, would appear a *thankless* office. *Wotton.*

**Thanklessly** (thank'les-ly), *adv.* In a thankless manner; without thanks; ungratefully; in a grudging spirit.

The species are mostly inhabitants of the countries of the Mediterranean. They are perennial herbs, with doubly or trebly pinnate leaves, large compound umbels, and yellow flowers. The roots possess acrid and corrosive properties. Fris. *that*, Icel. *thát*, D. *dat*, G. *das*, Cog. *Skr.* *sa*, *ad*, *that*. See also **THE**.] 1. A word used as a definitive adjective before a noun: (a) pointing to a person or thing as before mentioned or supposed to be understood; or used to designate a specific thing or person emphatically, having more force than the definite article *the*, which may, however, in some cases be substituted for it.

It shall be more tolerable for Sodom and Gomorrah in the day of judgment, than for *that* city. *Mat. x. 15.*

The woman was made whole from *that* hour. *Mat. ix. 22.*

(b) Frequently used in opposition to *this*, in which case it refers to one of two objects already mentioned, and often to the one most distant in place or time; frequently, however, mere contradiction is implied; as, I will take *this* book, and you can take *that* one.

Of Zion it shall be said, *this* and *that* man was born in her. *Pt. lxxvii. 5.*

(c) Pointing not so much to persons and things as to their qualities, almost equivalent to *such*, or of such a nature, and occasionally followed by *as* or *that* as a correlative.

'There cannot be *that* vulture in you to devour so many.' *Shak.* 'Entertained with *that* ceremonious affection as you were wont.' *Shak.* 'Whose love was of *that* dignity *that*

it went hand in hand with the vow.' *Shak.*  
2. Used absolutely or without a noun as a demonstrative pronoun (a) to indicate a person or thing already referred to or implied, or specially pointed at or otherwise indicated, and having generally the same force and significance as when used as an adjective; as, give me *that*; do you see *that*? (b) Used in opposition to *this*, or by way of distinction.

If the Lord will, we shall live, and do *this* or *that*.  
Jan. iv. 15.  
*This* is not fair; nor profitable, *that*. *Dryden*.

When *this* and *that* refer to foregoing words, *this*, like the Latin *hic* or the French *ici* (*this*), refers to the last mentioned, the latter, and *that*, like the Latin *ille* and French *celui*, to the first mentioned, the former. This is an artificial grammatical rule, probably founded on the Latin one, and adopted by writers, but it can scarcely be said to rest on any logical conception or law of thought.

Self-love and reason to one end aspire,  
Pain their aversion, pleasure their desire;  
But greedy *that*, its object would devour;  
*That* taste the honey, and not wound the flower. *Pope*.

In all the above cases, *that*, when referring to a plural noun, takes the plural form *those*; as, *that* man, *those* men; give me *that*, give me *those*; and so on. (c) Used to represent a sentence or part of a sentence, or a series of sentences.

And when Moses heard *that*, he was content.  
Lev. x. 30.

*That* here stands for the whole of what Aaron had said, or the whole of the preceding verse.

I will know your business, *that* I will. *Shak.*  
*That* sometimes in this use precedes the sentence or clause to which it refers.

*That* be far from thee, to do after this manner, to stay the righteous with the wicked. *Gen. xviii. 25.*

*That* here represents the clause in Italian. It is used also as the substitute for an adjective; as, you allege that the man is innocent; *that* he is not. Similarly it is often used to introduce an explanation of something going before. 'Religion consists in living up to those principles, *that* is, in acting in conformity to them.' (d) Used emphatically, with a predicate, in phrases expressive of approbation, applause, or encouragement. 'Why, *that's* my dainty Ariel!' *Shak.* 'That's my good son!' *Shak.* (e) By the omission of the relative *that* often acquires the force of *that which*; this is, however, not in accordance with modern usage.

I saw *that* I eat, get *that* I wear. *Shak.*  
We speak *that* we do know, and testify *that* we have seen.  
Job. iii. 11.

3. Used as a relative pronoun, and in many cases equivalent to *who* or *which*. It cannot, however, be relatively used with a preposition preceding it, but may be so used when the preposition is transposed to the end of the clause; thus we say, the man of whom I spoke, the book from which I read, the spot near which he stood, the pay for which he works; but we cannot say the man of *that* I spoke, &c., though we may say, the man *that* I spoke of, the book *that* I read from, the place *that* he stood near, the pay *that* he works for, and so on. When the relative clause conveys an additional idea or statement, *who* and *which* are rather to be used than *that*, which, indeed, is sometimes inadmissible; thus we say: 'James, whom I saw yesterday, told me,' but not 'James *that*.' *That* properly introduces a restrictive and explanatory clause (as exemplified by 'The man *that* I spoke of,' &c.), and though *who* and *which* are frequently used in the same way, the use of *that* often avoids ambiguity. See under *WHO*.

He *that* reprovesth a scorner getteth to himself shame.  
Prov. ix. 7.

In the following extract *that*, *who*, and *which* are used without any perceptible difference.

Sometimes like apes *that* mow and chatter at me  
And after *that* me, then like hedgehogs *which*  
Lie tumbling in my barefoot way and mount  
Their prickly *that* my footfall, sometime an I  
All wound with adders, *who* with cloven tongues  
Do hiss me into madness. *Shak.*

With its use as a relative to be classed those cases in which it is used as a correlative to *so* or *such*. 'Who's so gross that cannot see this palpable device?' *Shak.* 'Who so firm that cannot be seduced?' *Shak.* 'Such allowed infirmities that honesty is never free of.' *Shak.*—*That*, as a demonstrative and as a relative pronoun, may

sometimes occur close together, but this use is now scarcely considered elegant.

*That that* is determined shall be done. *Dan. xi. 36.*  
*That that* dieth, let it die. *Zech. xi. 9.*

**That** (THAT), conj. 1. Introducing a reason; in *that*; because. 'Not *that* I loved Caesar less, but *that* I loved Rome more.' *Shak.*  
It is not *that* I love you less  
Than when before your feet I lay. *Waller*.

2. Introducing a drift or object or final end or purpose—the phrases in order *that*, for the purpose *that*, to the effect *that*.  
Treat it kindly, *that* it may  
Wish at least with us to stay. *Cowley*.

3. Introducing a result or consequence.  
The custom and familiarity of these tongues do sometimes so far influence the expressions in these epistles *that* one may observe the force of the Hebrew conjugations. *Locke*.

4. Introducing a clause as the subject or object of the principal verb, or as a necessary complement to a statement made.

'Tis childish error *that* they are afraid. *Shak.*  
Albert I will confess thy father's wealth  
Was the first motive *that* I woo'd thee, Anne. *Shak.*

I have shewed before *that* a mere possibility to the contrary can by no means hinder a thing from being highly credible. *Sp. Wilkins*.

5. Added formerly to other conjunctions or to adverbs for the sake of emphasis. 'After *that* things are set in order here, we'll follow them.' 'Take my soul, before *that* England give the French the foil.' 'What would you with her if *that* I be she?' 'Since *that* my case is past the help of law.' 'When *that* my eye is famished for a look.' *Shak.*—6. Used elliptically to introduce a sentence or clause expressive of surprise, indignation, or the like. 'O *that* a brother should be so peridious!' 'O God, *that* men should put an enemy in their mouths to steal away their brains!' *Shak.*—7. Used as an optative particle or to introduce a phrase expressing a wish. 'O, *that* you bore the mind *that* I do!' *Shak.*—In *that*, for the reason *that*; because.

Things are preached not *in that* they are taught, but *in that* they are published. *Hooker*.

It consists of a circular card, having two strings fixed to it at the extremities of a diameter. On one side of the card there is drawn any object, such as a chariot, and on the other the charioteer in the attitude of driving, so that when the card is twirled round rapidly by the strings the charioteer is seen driving the chariot.

**Thaumaturge** (tha'ma-túrj), n. [See *THAUMATURGUS*.] A dealer in miracles; a miracle worker.

G. *de*, Sw. and Dan. *den*, G. *der*. In Anglo-Saxon the article underwent inflection, and the *the* used before a comparative represents the instrumental case *thi*, *thy*, the English phrase the more the better thus corresponding closely to the Latin *quo magis*, *eo melius*.] 1. Used before nouns with a specifying or limiting effect; as, the laws of the twelve tables; the independent tribunals of justice in our country are the security of private rights and the best bulwark against arbitrary power; the sun is the source of light and heat.—2. [The *is* generally pronounced with the vowel sound short, before a vowel answerable like *is* *pie*, *use*, and a consonant answerable like *is* *best*, but when used emphatically it is lengthened, as in poetry the *is* was formerly always, and is still sometimes, cut off in printing before a word beginning with a vowel sound. 'Shook th' arsenal and furnished over Greece' *Milton*. The old contracted form *y* arose from a confusion between the old character for *th* and that for *y*—of course the *y* was never pronounced as *y*.]

One of the religious orders founded at Rome in 1524, principally by Giampietro Caraffa, archbishop of Chieti, in Naples, the Latin name of which is *Theo*, hence the name (*Theatine* or *Theatin*) given to the order. Besides taking the usual monastic vows, the Theatines bound themselves to preach against heretics, to take upon them the cure of souls, to attend the sick and criminals, to abstain from possessing property, and not even to ask for alms, but to trust to Providence for support, expecting, however, that this support would be derived from the voluntary aims of the charitable. There were also Theatin nuns, who spent their whole time in solitude and prayer. The order flourished considerably in France, Spain, and Portugal, but its influence is now chiefly confined to the Italian provinces.

**Theatine** (thé'a-tin), *a.* Of or pertaining to the Theatines.

**Theatre** (thē'ā'tēr), n. (Fr. *théâtre*, from L. *theatrum*, from Gr. *theatron*, from *theatōnai*, to see, *thea*, a view) 1 A building appropriated to the representation of dramatic spectacles, a play house. Among the Greeks and Romans theatres were the chief public edifices next to the temples, and its point of magnitude they surpassed the most spacious of the temples, having in some instances accommodation for as many as from 10,000 to 40,000 spectators. The Greek and Roman theatres very closely resemble each other in their general form and principal parts. The building was of an oblong semicircular form, resembling the half of an amphitheatre, and was not covered by a roof. The space appropriated to the seats of the spectators was termed *caeca* by the Romans and *koilon* by the Greeks. The seats were all concentric with the orchestra, and were intersected in one direction by aisles or flights of steps, dividing the seats into so many compartments. The place for the players, in front of the seats, was called *scenae* (*skēnē*). The semicircular space between the seats and the seats of the spectators was called the *orchestra* (*orchēstra*), appropriated by the Greeks to the chorus and musicians, and by the Romans to the senators. Besides these essential parts there were the *proscenium* or stage proper, the *proscenium*, and *metascenium*, with regard to which

parts the Greek and Roman theatres differed considerably. Scenery, in the modern sense of the word, was not employed.

**Theatre of Bosnia. Newly-recovered**

but the stage machinery seems in many cases to have been elaborate. In the early days of the modern theatre the buildings were only partially roofed, and the stage, but scantily if at all provided with scenery. The interior of the theatres of the present day are usually constructed on a horse shoe or semicircular plan, and several tiers of galleries run round the walls. The orchestra is now solely occupied by the musical class of the establishment, and the stage, which has a slight downward slope from the back, is furnished with movable scenes, which give an air of reality to the spectacle quite unattainable in the ancient theatre.—2 A room, hall, or other place, generally with a platform at one end, and ranks of seats rising step-wise as they recede, or otherwise so arranged that a body of spectators can have an unobstructed view of the platform. Places of this description are constructed for public lectures, scholastic exercises, anatomical demonstrations, surgical operations before a class, and the like.—3 A place rising by steps or gradations like the seats of a theatre.

Simple larceny, or theft, is committed by wrongfully taking, against the will of the owner, and carrying away the goods of another with the fraudulent and felonious intent wholly to deprive him of his property therein. Hence it requires an actual taking, and an actual carrying away for some distance, to constitute the offence. Compound larceny or theft is when the theft is accompanied by aggravating circumstances, as when it is committed upon the person, or consists in stealing from a dwelling-house. Taking from the person in a violent manner is robbery, and stealing in a dwelling-house after having broken therein is burglary. (See *LARCENY*.) In Scots law, theft is defined 'the intentional and clandestine taking away of the property of another from its legitimate place of deposit, or other locus tenendi, with the knowledge that it is another's, and the belief that he would not consent to its abstraction, and with the intention of never restoring it to the owner.' 2. **Theology** (thé-o'-o-jí), *n.* [Fr. *théologie*, from Gr. *theologia*—*theos*, God, and *logos*, discourse.] Divinity; the entire science of the (Christian) religion; the science which treats of God and man in all their known relations to each other; the science which treats

(a) of the character and attributes of God; (b) of the doctrine of man in his relations to God; (c) of the doctrine of the salvation of man through the person and work of Christ; (d) of the doctrines of the final state of all men; and (e) the doctrine of the church, its constitution and government. In reference to the sources whence it is derived, theology is distinguished into *natural* or *philosophical* theology, which relates to the knowledge of God from his works by the light of nature and reason; and *supernatural*, *pontine*, or *revealed* theology, which sets forth and systematizes the doctrines of the Scriptures.

Theology is variously divided according to the method of treating the subject, and the part of the subject which is treated.—*Dogmatic* or *theoretical* theology, that part of the science which aims pre-eminently to state what is authoritatively taught, whether by the Scriptures, the councils, or the creeds.—*Exegetical* theology embraces the interpretation of the Scriptures, the science which teaches the principles to be observed in interpretation; and biblical criticism, which examines and tries to establish the genuine text, the authenticity of the various books of the Bible, and the discussion of kindred subjects.—*Historical* theology treats of the history of Christian doctrines, of heresies of the church, of councils, and the like.—*Metaphysical* theology aims to substantiate the teachings of the Bible by an appeal to those primitive cognitions and primary beliefs which the Bible always assumes.—*Moral* theology, which Bible formerly to use, covered the ground now occupied by moral philosophy or Christian ethics.—*Polemical* theology, or theological controversy, seeks to overthrow the positions of other systems as well as to defend its own.—*Practical* theology consists of an exhibition, first, of precepts and directions, and secondly, of the motives from which we should be expected to comply with these.—

*Rational* theology gives to human reason the highest authority in determining what is theological truth.—*Scholastic* theology either proceeds by reasoning or derives the knowledge of divine things from certain established principles of faith.—*Speculative* theology, a system in which theory predominates over Scripture and all other authority.—*Systematic* theology arranges methodically the great truths of religion, so as to enable us to contemplate them in their natural connection, and to perceive both the mutual dependence of the parts and the symmetry of the whole. A theory is often nothing else but a contrivance for comprehending a certain number of facts under one expression. Many theories are founded entirely on analogy, and such theories may have all degrees of evidence from the least to the greatest. The evidence of a theory increases with the number of facts which it explains, and the precision with which it explains them. It diminishes with the number of facts which it does not explain, and with the number of different suppositions that will afford explanations equally precise. A theory may not deserve to be rejected because it does not explain all the phenomena, if it explains a great number and be not absolutely inconsistent with any one, but a single fact inconsistent with any theory may be sufficient to overturn it.—*Theory* is distinguished from *hypothesis* thus: a *theory* is founded on inferences drawn from principles which have been established on independent evidence; a *hypothesis* is a proposition assumed to account for certain phenomena, and has no other evidence of its truth than that it affords a satisfactory explanation of those phenomena. It is necessary to keep this distinction in view, as the terms *theory* and *hypothesis* are very frequently confounded both in speaking and writing.

**Thermo-electricity** (thér-mō-ē-lek'tris-i-tē), *n.* 1. Electricity produced at the junction of two metals, or at a point where a molecular change occurs in a bar of the same metal, when the junction or point is heated above or cooled below the general temperature of the conductor. Thus when wires or bars of metal of different kinds, as bis-

moth and antimony, are placed in close contact, and to end, and disposed so as to form a periphery or continuous circuit, and heat then applied to the ends or junctions of the bars, electric currents are produced. — 2. The science that treats of the electric currents that arise from heating the junction of two heterogeneous conductors. — *Thermo-electric alarm*, an apparatus designed to indicate the rise of temperature beyond a certain desired point; as for instance to show when the bearings of shaftings are overheated, or when a room is too warm from overheating or in danger from fire. It consists of a thermometer having a wire passing through the bulb, and so connected with the mercury; and another entering the tube at the top, and extending a certain distance downwards. Each of these wires is connected with a small open circuit having an electric battery and bell. Suppose the presence of fire in an apartment may be inferred from the temperature rising to 100°, this actual rise may be indicated by having the end of the top wire set in the tube opposite this degree on the scale. When the mercury rises and touches 100° the circuit is completed and the bell rung. — *Thermo-electric battery*, or *pile*, an apparatus much used in delicate experiments with radiant heat. It consists of a series of little bars of antimony and bismuth (or any other two metals of different heat-conducting power), having their ends soldered together and arranged in a compact form: the opposite ends of the pile being connected with a galvanometer, which is very sensibly affected by the electric current induced in the system of bars when exposed to the slightest variations of temperature. To the combined arrangement of pile and galvanometer the name of *thermo-multiplier* is given. — *Thermo-electric pair*, two metal bars of different heat-conducting power, having their ends soldered together, and the combined bar then usually bent into a more or less horse-shoe or magnet form for the purpose of bringing their free ends within a conveniently short distance. They are used in thermo-electric experiments, but as the electric current developed in a single pair is very weak, a considerable number are usually combined, thus forming the thermo-electric pile or battery. Bismuth and antimony are the metals usually employed, the difference in electro-motive force being greater between them than between any other two metals conveniently obtainable.

**Thermo-magnetism** (thér-mō-mag-net-izm), *n.* Magnetism resulting from, or as affected by, the action of heat.

**Thermometer** (thér-mom'-et-ēr), *n.* [Gr. *thermos*, warm, from *thermē*, heat, and *metron*, measure.] An instrument by which the temperatures of bodies are ascertained; founded on the property which heat possesses of expanding all bodies, the rate or quantity of expansion being supposed proportional to the degree of heat applied, and hence indicating that degree. The thermometer consists of a slender glass tube, with a small bore, containing in general mercury or alcohol, which expanding or contracting by variations in the temperature of the atmosphere, or on the instrument being brought into contact with any other body, or immersed in a liquid or gas which is to be examined, the state of the atmosphere, the body, liquid, or gas, with regard to heat, is indicated by a scale either applied to the tube or engraved on its exterior surface. The ordinary thermometer consists of a small tube, terminating in a ball containing mercury, the air having been expelled and

the tube hermetically sealed. There are two points on the scale, corresponding to fixed and determinate temperatures, one, namely, to the temperature of freezing water, and the other to that of boiling water. In the thermometer commonly used in this country, that of Fahrenheit, the former point is marked 32° and the latter 212°; hence the zero of the scale, or that part marked 0°, is 32° below the freezing-point, and the interval or space between the freezing and boiling points consists of 180°. The zero point is supposed to have been fixed by Fahrenheit at the point of greatest cold that he had observed, probably by means of a freezing-mixture such as snow and salt. On the Continent, particularly in France, and nowadays in all scientific investigations, the Centigrade thermometer is used. The space between the freezing and boiling points of water is divided into 100 equal parts or degrees, the zero being at freezing and the boiling-point at 100°. Réaumur's thermometer, which is in use in Germany, has the space between the freezing and boiling points divided into 80 equal parts, the zero being at freezing. The following formulae will serve to convert any given number of degrees of Fahrenheit's scale into the corresponding number of degrees on Réaumur's and the Centigrade scales, and vice versa: Let *F*, *R*, and *C* (the 0° of *C*, and *B* being equal to *F* 32°, and the three scales from freezing to boiling point being *F* 180°, *C* 100°, *R* 80°, or in the ratio of 9°, 5°, 4°) represent any corresponding numbers of degrees on the three scales respectively, then: (*F* - 32°) ×  $\frac{5}{9}$  = *R*; (*F* - 32°) ×  $\frac{5}{9}$  = *C*; *R* ×  $\frac{4}{5}$  = *C*; *C* ×  $\frac{5}{4}$  = *R*; *C* ×  $\frac{9}{5}$  = *F* - 32°; *C* ×  $\frac{9}{5}$  = *F*. For extreme degrees of cold, thermometers filled with spirit of wine must be employed, as no degree of cold known is capable of freezing that liquid, whereas mercury freezes at about 39° below zero on the Fahrenheit scale. On the other hand, spirit of wine is not adapted to high temperatures, as it is soon converted into vapour, whereas mercury does not boil till its temperature is raised to 660° F. Mercury is most commonly used for thermometers employed for indicating all ordinary temperatures. For recording extremely high temperatures the pyrometer is used; and for indicating very slight variations the thermo-electric battery is employed. As the ordinary thermometer gives the temperature only at the time of observation, the necessity for having an instrument which would show the maximum and minimum temperatures within a given period is easily apparent in all cases connected with meteorology, and various forms of instruments for this purpose have been invented. A common form of *maximum thermometer* consists of the ordinary thermometer fitted with a piston which moves easily in the tube. The instrument is placed horizontally, and the piston is pushed along the bore as the mercury advances, and is left at the highest point by the retreating fluid. This point is noted by the observer, who then erects the thermometer, causing the piston to sink to the mercury, the instrument thus being in condition for a fresh experiment. A similar action takes place in the spirit of wine *minimum thermometer*, the small movable piston being, however, immersed in the fluid and drawn back by the convex surface of the contracting fluid, being left at the point of greatest contraction. The maximum and minimum instruments combined form the *register or self-registering thermometer*.—*Chromatic thermometer*, an arrangement of glass plates devised by Sir David Brewster, exhibiting the difference between their temperature and that of an object with which they are brought in contact by the different hues of the polarized light produced in the plates.—*Differential thermometer*. See DIFFERENTIAL.

A thermostat was contrived by Dr. Ure for regulating temperature in the processes of distillation and vaporization in baths, hot-houses, in adjusting the heat of stoves and furnaces, &c. It operates upon the principle that when two thin metallic bars of different degrees of expansibility are riveted or soldered faceways together, any change of temperature will cause the compound bar to bend, the side on which the least expansible bar is becoming concave, and the other convex. These flexures are made to operate in regulating valves, stop-cocks, stove-registers, &c., and thereby to regulate the flow of heated liquids, or the admission or emission of air.

**Thermostatic** (thér-mô-stat'ik), *a.* Pertaining to the thermostat.

Any one simple enough to bet with him is seldom allowed to win, as the pea is generally abstracted by sleight of hand.

(See *THOU*.)] 'In the twelfth century the *n* dropped off before a consonant, but was retained (a) in the oblique cases, (b) in the plural (with final *e*), (c) when the pronoun followed the substantive, and (d) before a word beginning with a vowel.' *Dr. Morris*. The loss of the *n* produced the more modern form (*thy*.) *Thy*; belonging to thee; relating to thee; being the property of thee. The following quotations give examples of the euphonic use of *thine* before a vowel, while *thy* is used before a consonant.

Gave every man *thine* ear, but few *thy* voice. *Shak.*

When thou comest into *thy* neighbour's vineyard then thou mightest eat grapes *thy* fill at *thine* own pleasure. *Deut. xxiii. 24*.

In modern writings *thy* and *thine* are both used before vowels, according to the individual predilections of the writer. Like *hers*, *ours*, *yours*, *theirs*, *mine*, *his*, *thine* is used independently or absolutely, that is, without the noun with which it is associated, serving either for a nominative or objective or a predicate; as, *thine* is good; give him *thine*; that book of *thine*. In these uses *thine*, &c., are used exactly like the possessive of a noun. It is to be observed that *thine*, like *thou*, is now used only in poetry, in solemn discourse, and in the common language of the Quakers. In familiar and common language *your* and *yours* are always used in the singular number as well as the plural.

The root meaning and connections of this word are doubtful. Some connect it with A. Sax. *thīhan* or *thēon*, O. E. *thēo*, to grow, thrive. The development of meanings judicial suit or controversy, cause, sake, thing, is similar to that seen in L. *causa*, a cause or suit, which becomes Fr. *chose*, a thing. See also *SAKE*.] 1. This is composed of the pronominal stems *thi* (Skr. *ta*) seen in *the*, *that*, *thither*, *etc.*, and *sa*, *as*, *he* (=Skr. *sa*, *he*). 1. Who did *this*, *this* man or his parents, that he was born blind? Jn. ix. a.

When they heard *this*, they were pricked in their heart. Ac. ii. 37

In the latter passage this is a substitute for what had preceded, viz. the discourse of Peter just delivered. In like manner *this* often represents a word, a sentence, or clause, or a series of sentences or events. In some cases it refers to what is to be immediately related or done.

Origin doubtful.] The common name of prickly plants of the tribe Cynaraceae, nat. order Compositae. The genus *Cirsium* with its sub-genera *Cirsium* or *Calceus* and *Silybum* contains the greatest number of those commonly recognized. There are numerous species, most of which are inhabitants of Europe, as the musk-thistle (*Cirsium vulgare*), milk-thistle (*C. marianum*), wetted thistle (*C. acanthoides*), slender-flowered thistle (*C. tenuiflorus*), the spear-thistle (*Cirsium lanceolatum*), and field thistle (*Cirsium arvense*), a well-known plant, very troublesome to the farmer. The blessed-thistle (*Carduus benedictus*) of the pharmacopoeias, *Cirsium benedictus* or *Crucium benedictum* of modern botanists, is a native of the Levant,

and is a laxative and tonic medicine. The name thistle is also given to numerous prickly plants belonging to other genera, as the cotton-thistle belongs to the genus *Oenopodium*. The common cotton-thistle (*O. acanthium*) attains a height of from 4 to 6 feet. It is often cultivated as the Scotch thistle, but it is doubtful whether the thistle which constitutes the national badge has any existing type, though the stemless thistle (*Cirsium acaule* or *Cirsium acaule*) is in many districts of Scotland looked on as the true Scotch thistle. The carline thistle belongs to the genus *Carlina*; the star-thistle is the *Centaurea Cnicifolia*. The sow-thistle belongs to the genus *Sonchus*, and the globe-thistle to the genus *Echinops*. Some species of the thistle are admitted into gardens, where they form a pretty variety for borders. Thistles sow themselves extensively by means of their winged seeds, and hence they are great pests to the farmer. The thistle seems to have been a national emblem in Scotland in the time of James III., and it was evidently well known as such when Dunbar wrote his poem of the 'Thistle and the Rose' (1503).

—Order of the Thistle, a Scottish order of knighthood, sometimes called the order of St. Andrew. It was instituted by James VII. (James II. of England) in 1687, when

eight knights were nominated. It fell into abeyance during the reign of William and Mary, but was revived by Queen Anne in 1703. The insignia of the order consist of a gold collar composed of thistles interlaced with sprigs of rue, the jewel, a figure of St. Andrew in the middle of a star of eight pointed rays, suspended from the collar, the star, of silver and eight-rayed, four of the rays being pointed, while the alternate rays are shaped like the tail-feathers of a bird, with a thistle in the centre surrounded by the Latin motto *Nemo me impune lacessit*, and the badge, oval, with the motto surrounding the figure of St. Andrew. The order consists of the sovereign and sixteen knights, besides extra knights (princes), and a dean, a secretary, the lion-king-at-arms, and the gentleman usher of the green rod.

The name *Thor*, Icel. *Thorr*, the Scandinavian god of thunder, is simply a form of this word.] 1. The sound which follows a flash of lightning; a report due to the sudden disturbance of the air produced by a violent discharge of atmospheric electricity or lightning. The character of the sound varies with the force and the distance of the discharge and the nature of the surrounding country, and is no doubt affected by the relative positions of the clouds. A person in the immediate neighbourhood of a flash of lightning hears only one sharp report, the sharpness being greatly intensified when an object is struck by it. A person at a distance hears the same report as a prolonged peal, and persons in situations at some distance apart hear it each in a different way. These differences have not yet been satisfactorily accounted for; the long rolling effect may be due to echoes from the clouds, and perhaps partly to there being a number of partial discharges from the same cloud at different distances from the observer. As sound travels at the rate of 1100 feet per second, while the passage of light is almost instantaneous, the distance of the observer from the discharge may be approximately estimated by dividing the interval in seconds between the flash and the report by 5 or 4.5, the product being the distance in miles to the place of discharge. Thunder has never been heard 20 miles from the flash. 2. The destructive agent in a thunder-storm; a discharge of lightning; a thunderbolt.

**Thunderbolt** (*thun'dér-bolt*), *n.* 1. A shaft of lightning; a brilliant stream of electricity passing from one part of the heavens to another, and particularly from the clouds to the earth. The name originated in the ancient notion that the destructive effects of lightning could be caused only by a shaft or bolt-like hard body being hurled at the object destroyed. The terms *thunderbolt* and *thunderstone* were hence frequently applied to certain concrete substances found in the earth which superstition credited with such dreadful effects. (See *THUNDERSTONE*.) In *Aer*, the thunderbolt is repre-

sented as a twisted bar in pale, inflamed at each end, surmounting two jagged darts in saltire, between two wings expanded, with streams of fire issuing from the centre.—2. *Fig.* a daring or irresistible hero.

Bengal Tiger (*Felis tigris*).

the genus *Felis*, *F. tigris* (sometimes classified as *Tigris regia*), family Felidae. The tiger is about the height of the lion, but the body is longer, and the head rounder. It is of a lively fawn colour above, a pure white below, irregularly crossed with black stripes. It is clothed with short hairs, and has no mane. White or albino varieties have been occasionally met with, a specimen having been shown in this country in 1820. The tiger attains his full development in India, the name of Bengal tiger being used as synonymous with those specimens which appear as the most typical and most powerful representatives of the species. The animal is also found in Java and Sumatra, and no traces of it are found beyond Southern Asia. In habits the tiger is far more active and agile than the lion, and exhibits a large amount of fierce cunning. He generally pitches upon a concealed spot near a water course as a habitat, and springs upon the animals that approach to drink, slinking back to his lair as if discomfited and ashamed should his first bound be unsuccessful. His tread through the thick jungle is noiseless and stealthy, and he appears to avoid rather than court danger, unless when brought to bay, when he turns an appalling fierce front to the foe. These animals do not generally readily attack man himself, but in some cases they seem to acquire a special liking for human prey, and boldly approach villages for the purpose of securing it; such being known as 'man-eaters'. The natives destroy them by traps, pits, poisoned arrows, and other means. Tiger hunting is a favourite Indian sport. It is pursued generally by Europeans, the tiger being shot from the back of an elephant. When taken young the tiger can be tamed, and tigers thus domesticated are not rarely to be seen in India. The name American tiger is frequently applied to the jaguar (*Felis onca*). (See **JAGUAR**.) The character and number of these secondary tones coexisting with the principal note is the cause of the *timbre* or quality of sound peculiar to different instruments.

The general idea of successive existence; the measure of duration. Time is *absolute* or *relative*; *absolute time* is considered without any relation to bodies or their motions. It is conceived by us as unbounded, continuous, homogeneous, unchangeable in the order of its parts, and divisible without end. *Relative time* is the sensible measure of any portion of duration, often marked by particular phenomena, as the apparent revolution of the celestial bodies, more especially of the sun, or the rotation of the earth on its axis. Time is divided into years, months, weeks, days, hours, minutes, and seconds; but of these portions the years and days only are marked by celestial phenomena. In order to measure time we employ some equable motion, and we judge those times to be equal which pass while a moving body proceeding with a uniform motion passes over equal spaces. The instruments employed for measuring time are clocks, chronometers, clepsydras, hour-glasses, and dials; but the three first are those chiefly used. Time is often poetically personified as masculine. 'The plain bald pate of father Time himself.' *Shak.*

Why grieve that Time has brought so soon  
The sober age of manhood on?  
As idly should I weep at noon  
To see the blush of morning gone. *Bryant.*

spoke in time past unto the fathers by the prophets,  
&c. *Heb. i. 1.*

3. A proper time; a season proper or appropriate to something; hence, opportunity.

under the heaven. *Eccles. iii. 1.*

Conspiracy his time doth take. *Shak.*

After-wits are dearly bought. *Southwell.*

4. An age; a part of duration distinct from other parts; the period at which any definite event occurred or person lived; as, the time of Elizabeth.

Could make him the receiver of. *Shak.*

That ever I was born to set it right. *Shak.*

9. Leisure; sufficient time; convenience of time; as, I have not time to speak with you now.

I have resolved to take time, and in spite of all misfortunes, to write you, at intervals, a long letter. *Swift.*

Living to time. *Shak.*

12. In *music*, (a) the relative duration of a sound (or rest) as measured by the rhythmic proportions of the different notes, taking the semibreve (C) as the unit or standard, the minim (J) being half the semibreve, the

crotchet (Q) half the minim, the quaver (J)

half the crotchet, and so on. Thus, should a semibreve be sounded (say) 8 seconds of time, a minim would occupy 4 seconds, a crotchet 2, a quaver 1, and so on. (b) The style of movement or peculiarity of accent in a composition, such as is marked by the regular grouping of a certain and equal number of notes, or of more or less notes equal in time value to that certain number, through all the bars of a movement; the different combinations of sounds and values being said to constitute different kinds of time, each indicated by a different rhythmic or time signature. These measures or divisions are of several kinds, but may be all ranged in two classes, *duple* or *binary* time and *triple* or *ternary* time, the former being marked by two beats and the latter by three beats to the measure or bar. It is essential to music and verification. See *PHRENOLOGY*. — 15. One of the three dramatic unities formerly considered essential in the classical drama. The unity of time consisted in keeping the period embraced in the action of the piece within the limit of twenty-four hours. See *UNITY*. — *Apparent time*, time regulated by the apparent motion of the sun; time as shown by a properly adjusted sun-dial; solar time. — *Astronomical time*, mean solar time reckoned from noon through the twenty-four hours. — *At times*, at distinct intervals of duration. This expression, which occurs frequently in Scotch and Border ballad literature, has been differently but probably less correctly explained.

2. In animal anat. the texture or grouping of anatomical elements of which the systems of organs are composed; the primary layers composing any of the parts of animal bodies. The classification of tissues may now be said to be arranged on two different principles, having reference either to special histology, which concerns itself with the structure of organs in which a combination of various tissues may enter; or to general histology, which treats of the tissues properly so called. Hence, under the first arrangement we speak of *muscular tissue*, or *flesh*; *osseous tissue*, or *bone*; *adipose tissue*, or *fat*; *cartilaginous tissue*, or *gristle*; *pigmentary tissue*, or colouring matter seen in the skin, in the choroid coat of the eye, the iris, &c.; *areolar, cellular, or connective tissue*, widely distributed in every part of the body, and serving to bind together and consolidate other parts and tissues. According to the second system of grouping we have, (a) *cellular tissue*, which consists entirely of cells, in which cell lies close to cell, such as occur in the epidermis, nails, the epithelium, or living membranes of the inner surfaces of the body, &c.; (b) *connective tissue*, in which one cell is regularly separated from the others by a certain amount of intermediate or intercellular substance, as exemplified in cartilage, fat, &c.; (c) more highly developed tissues in which the structures are usually more or less tubular; this group including the muscles, nerves, and vessels, and, in Virchow's arrangement, the blood. It is to be observed that though the terms in the two classifications may have a correspondence in name, the correspondence does not extend strictly to the nature of the tissues to which they are applied. The terms *adventitious, accidental, or pathological tissue* have been applied generally to morbid productions resembling any of the natural or physiological tissues. The belief is gaining currency that every pathological tissue has its physiological or normal prototype, and that the abnormality consists either in its production at the wrong place or time, or to an excessive extent.

3. In vegetable anat. the minute elementary structures of which the organs of plants are composed. These elementary structures differ from each other, and are so minute as generally to be distinctly visible only with the aid of the microscope. They are named *elementary organs, organic tissue*, or

**vegetable tissue.** When a leaf or a portion of the stem of one of the higher plants is submitted to the microscope it is found to consist, (1) of a thin transparent homogeneous membrane, which is arranged in the form of cells or cylindrical tubes; (2) of fibres which are arranged in a spiral form in the interior of the cells or tubes; and (3) of a fluid, filling the cells, and existing between them, and containing in it globules of various sizes and kinds. These parts constitute what are known respectively as elementary membrane, elementary fibre, and organic mucus. The elementary fibre is only found in the higher forms of plants, the other two are found in all plants. The tissues of plants then are composed of elementary membrane and elementary fibre, and the principal forms under which they

1. Prosenchyma or Woody Tissue. 2. Horizontal section of Prosenchymatous Tissue. 3. Round or Elliptical Parenchymatous Tissue. 6. Spongiform or Stellate Tissue.

exhibit themselves constitute the cellular tissue, fibrous tissue, and vascular tissue. **Cellular tissue**, often called **parenchyma**, is composed of membrane in the form of cells or cavities which are closed on all sides, and are commonly of a spheroidal form, although they often assume various other forms. The pith of plants is entirely composed of cellular tissue, but it enters largely into the structure of other parts, and in many, as in the mushroom and sea-weed orders, is the only tissue. **Fibrous tissue** is that in which the elementary fibre alone is apparent. When the cells are composed of membrane and spiral fibre combined, or of fibre alone (as in some instance when the membrane appears to have been absorbed during growth), they constitute the **fibro-cellular tissue**. **Vascular or tubular tissue** is composed of very elongated membranous tubes, tapering at each end. It comprehends the woody (also called **prosenchyma**) and laticiferous tissues. When the tubes have within them a spiral fibre, or their walls marked with broken spiral lines or dots, arranged in a circular or spiral direction, they constitute **fibro-vascular tissue**.—4. A connected series; as, the whole story is a **tissus** of forgeries or of falsehood.

**Titania** (ti-tä'ni-ä), n. The queen of Fairyland and consort of Oberon.

The Shakespearean commentators have not thought fit to inform us why the poet designates the Fairy-queen **Titania**. It, however, presents no difficulty. It was the belief of those days that the Fairies were the same as the classic Nymphs, the attendants of Diana. . . . The fairy-queen was therefore the same as Diana, whom Ovid (*Met.* iii. 173) styles **Titania**. *Knightley*.

**Titanium** (ti-tä'ni-um), n. [So called in fanciful allusion to the Titans. See **TITAN**.] Sym. Ti. At. wt. 50. A metal discovered by Gregor in 1791, in a black sand in Cornwall. It was afterwards discovered by Klaproth in some other minerals, and he gave it the name it now bears. In 1822 Wollaston examined it, and ascertained its properties. It is found combined with oxygen in several minerals, and occurs occasionally in combination with nitrogen in the slag ironworks as small cubical crystals, exactly similar to bright copper in appearance, of specific gravity 5.3, and very infusible. When heated with nitre these crystals are oxidized, producing titanic acid. Titanium is a dark green, heavy, amorphous powder. Oxygen and titanium combine, forming the sesquioxide Ti<sub>2</sub>O<sub>3</sub>, which is a black powder, and the peroxide or titanic acid, TiO<sub>2</sub>. Titanium also combines with chlorine, forming two chlorides, TiCl<sub>3</sub> and TiCl<sub>4</sub>, and with sulphur forming a sulphide, TiS<sub>2</sub>. This metal forms several compounds with nitrogen. The ores of this metal are called menachanite, from Menachan in Cornwall, where it was originally found; iserine, from the river Iser, in Silesia; nigrine, from its black colour; sphene, rutile, brookite, axotomous iron, crichtonite, ilmenite, mohsite, aeschynite, greenovite, and octahedrite or anatase.—**Titanium green**, ferrocyanide of titanium, precipitated by ferrocyanide of potassium from a solution of titanic chloride, recommended as an innocuous substitute for Schweinfurt-green and other arsenical green pigments. The tenth part of anything; specifically, the tenth part of the increase annually arising from the profits of land and stock and the personal industry of the inhabitants, allotted to the clergy for their support. In England tithes are *personal*, *predial*, or *mixed*; *personal*, when accruing from labour, art, trade, and navigation; *predial*, when issuing from the earth, as hay, wood, grain, and fruit; and *mixed*, when accruing from beasts which are fed from the ground.

Another division of tithes is into *great* and *small*. **Great tithes** consist of all species of corn and grain, hay, and wood; and **small tithes**, of predial tithes of other kinds, together with mixed and personal tithes. The **great tithes** belong to the rector, and are hence called *parsonage tithes*; and the latter are due to the vicar, and are hence called *vicarage tithes*. Tithes are either due de jure or by custom; to the latter class belong all personal tithes. The exemptions from tithes are composition, a *modus decimandi*, prescription, or act of parliament.—**Commutation of tithes**, the conversion of tithes into a rent-charge payable in money, and chargeable on the land. Several acts of parliament have been passed for effecting the commutation of tithes in England and Ireland. In regard to tithes in Scotland see **TEIND**.—2. A small part or proportion.

The five orders of nobility in Britain are distinguished by the titles of honour—Duke, Marquess, Earl, Viscount, and Baron; and the persons in whom the dignity of the peerage is borne are entitled to be designated by these words. The dignity of Baronet, besides its name, which is placed after the name and surname of the person, speaks of the privilege of prefixing Sir. This title, like the titles of peers, is hereditary. The dignity of knighthood, which is not hereditary, entitles those on whom the honour is conferred to the prefix Sir to their former name and surname. Municipal officers have

also titles accompanying them, as the Right Honourable the Lord Mayor, the Right Honourable the Lord Provost, the Lord Dean of Guild, &c., and in the law there are very eminent offices the names of which become titles of honour to the possessors of them, and which bring with them the right to certain terms of distinction.

(b) After the substantive verb, to denoting futurity. 'We are still to seek for something else.' *Bentley*. (c) After *have*, to denoting duty or necessity; as, I have a debt to pay. — Anciently to was often omitted where we should now insert it as a sign of the infinitive.

herbs rolled up in tubes called tobacco. *Charlevoix*, in his *History of St. Domingo*, says that the instrument used in smoking was called tobacco, and hence the name, and Humboldt adopts this view. In Hakluyt's *Voyages*, 1590, it is stated that there is an herb (in Virginia) which is towed apart by itself, and is called by the inhabitants *apocoe*. In the West Indies it has diverse names, according to the several places and countries where it grows and is used. The Spaniards call it tobacco. A genus of plants (Nicotiana), mostly herbaceous, but some shrubby, nat. order Solanaceae, natives of the

warm parts of America, Eastern Asia, and Australia.

There are several species, all narcotic. These most generally cultivated are *N. glauca* and *N. glauca*.

*N. glauca*, the former being often called Virginian tobacco. It is of an erect habit, and grows to the height of 4 or 5 feet, having

indecussate leaves from 8 to 18 inches long and 2-3 inches broad.

Being used as the name of the plants tobacco is also the name of the prepared leaves.

Tobacco has been employed in medicine as a stimulant, emetic, and purgative, but it is as a luxury that its use is so

widely diffused, the chief modes in which it is taken being smoking, snuffing, and chewing. The leaf undergoes various processes of manufacture in accordance with the mode in which it is to be used. Its use in America is of unknown antiquity. Among the North American Indians smoking has from time immemorial been regarded almost as a religious rite, the custom being associated with their most solemn and important transactions. *Mayan* states that its use in China is also of high antiquity. It was first introduced into Europe in 1566 by *Hernandez de Toledo*, who brought a small quantity from America into Spain and Portugal. Thence it was forth with spread into France and Italy. Its first employment in these countries being in the form of snuff. *Mr. F. Drake* introduced it into England in 1604, where tobacco taverns became nearly as prevalent as beer-shops. Its use was opposed strongly by both priests and rulers. *Pope Urban VIII* and *Innocent IX* issued bulls excommunicating such as used snuff in church, and in Turkey smoking was made a capital offence. In the canon of Rome the prohibition of the use of tobacco was put among the ten commandments immediately after that forbidding adultery. The *Constitution* of *James I* of England is master of history. All prohibitions, however regal or priestly, were of no avail, and tobacco is now the most extensively used luxury on the face of the globe. The most commonly used tobacco, and possibly the most esteemed, is the Virginian, but fine species or varieties are grown also in Cuba, Florida, and elsewhere. See *NICOTIANA*. — *Indian tobacco* (*Lobelia inflata*), a plant cultivated in the United States. It is used in medicine as an expectorant and diaphoretic, but it must be administered in small doses, as it is very poisonous. — *Mountain tobacco* (*Adiantum*), grows in alpine meadows. An Indian hatchet, used in the chase and in war, not only in close fighting, but by being thrown to a considerable distance, and so dexterously often, that the sharp edge first strikes the object aimed at. These hatchets have frequently the hammer-head hollowed out to suit the purpose of a smoking pipe, the mouth-piece being in the end of the shaft.

It was and is the custom of the Indians to go through the ceremony of burying the *tomahawac* when they made peace, when they went to war they dug it up again. See *THIN*, *TEND*.] 1. Any sound considered with relation to (a) its acuteness or gravity=pitch; (b) its openness, dulness, purity, sweetness, harshness, or the like=quality or timbre; (c) its

3. An affected or whimsical style of intonation in speaking or reading; a mournful or artificial mode of utterance; a sing-song or measured rhythmical manner of speaking; a drawl; a whine.

We ought certainly to read blank verse so as to make every line sensible to the ear; at the same time, in doing so, every appearance of sing-song and *tone* must be carefully guarded against. *Dr. Blair.*

4. In music, (a) the impression on the ear made by the undulations of the atmosphere, &c., produced by the vibration of a string or other sonorous body; a musical sound. Nearly every musical sound is composite, that is, consists of several simultaneous tones having different rates of vibration according to fixed laws, which depend on the nature of the sonorous body and the mode of producing its vibrations. The simultaneously sounding components are called *partial tones*; that one having the lowest rate of vibration and the loudest sound is termed the *prime*, *principal*, or *fundamental tone*; the other partial tones are called *harmonics* or *overtones*. Thus a single string produces not only its own prime or fundamental tone, but also its octave, twelfth, fifteenth (double octave), seventeenth, nineteenth, &c., of the

sounds belonging to  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , &c., of its length. Put in somewhat different and simpler words, the fundamental tone may be said to generate the other two tones of the major triad or common chord; that is, the third and the fifth, or their octaves, itself being the tonic or key-note. The quality of any sound (=timbre) is due partly to the presence or absence of overtones or harmonics in this series, and partly to the greater or less intensity of those present as compared with the fundamental tone and with one another: sounds composed of the above six elementary tones being rich and sweet. Under certain conditions it is found that two notes when sounded together produce by their combination other notes, which are not found as constituents of either; these are called *resultant tones*, and are of two kinds: *difference tones* and *summation tones*. A difference tone has a frequency of vibration which is the difference of the frequencies of its components; a summation tone has a frequency of vibration which is the sum of the frequencies of its components. As the components may either be fundamental tones or overtones, two notes which are rich in harmonics yield by their combination a large number of resultant tones. The difference tones were observed in the last century by Tartini, and have been therefore called *Tartini tones*. (b) One of the larger intervals between certain contiguous notes of the diatonic scale; as, the major tones, or intervals of 9 commas between C-D, F-G, and A-B; the minor tones, or intervals of 8 commas between D-E and G-A. The smaller intervals of 5 commas between E-F and B-C are called *semitones*. The terms *tone* and *semitone* are also applied to the artificial intervals adopted in the temperament of fixed-toned instruments. (See *TEMPERAMENT*.) (c) The peculiar quality of sound of any voice or instrument; timbre; as, a mellow or rich *tone*; a poor or thin *tone*; a reedy *tone*. [Note. The regrettable use of the word *tone* both for a sound, and for the interval between two sounds or tones, is confusing, but has been hitherto common, indeed almost universal, among musicians of the highest standing.]—5. That state of a body in which the animal functions are healthy and performed with due vigour; the state in which all the parts and organs have due tension or are well-strung; the strength and activity of the organs, from which proceed healthy functions.—6.
